Chapter 1

Overview

his chapter provides an overview of the DE5a-Net Development Board and installation guide.

1.1 General Description

The Terasic DE5a-Net Arria 10 GX FPGA Development Kit provides the ideal hardware solution for designs that demand high capacity and bandwidth memory interfacing, ultra-low latency communication, and power efficiency. With a full-height, 3/4-length form-factor package, the DE5a-Net is designed for the most demanding high-end applications, empowered with the top-of-the-line Altera Arria 10 GX, delivering the best system-level integration and flexibility in the industry.

The Arria® 10 GX FPGA features integrated transceivers that transfer at a maximum of 12.5 Gbps, allowing the DE5a-Net to be fully compliant with version 3.0 of the PCI Express standard, as well as allowing an ultra low-latency, straight connections to four external 40G QSFP+ modules. Not relying on an external PHY will accelerate mainstream development of network applications enabling customers to deploy designs for a broad range of high-speed connectivity applications. For designs that demand high capacity and high speed for memory and storage, the DE5a-Net delivers with two independent banks of DDR3 SO-DIMM RAM, four independent banks of QDRII+ SRAM, high-speed parallel flash memory. The feature-set of the DE5a-Net fully supports all high-intensity applications such as low-latency trading, cloud computing, high-performance computing, data acquisition, network processing, and signal processing.

1.2 Key Features

The following hardware is implemented on the DE5a-Net board:

■ FPGA

Altera Arria® 10 GX FPGA (10AX115N3F45I2SG)

■ FPGA Configuration

- On-Board USB Blaster II or JTAG header for FPGA programming
- Fast passive parallel (FPPx32) configuration via MAX II CPLD and flash memory

General user input/output:

- 8 LEDs
- 4 push-buttons
- 2 slide switches
- 2 seven-segment displays

Clock System

- 50MHz Oscillator
- Programmable clock generators Si5340A and Si5340B
- One SMA connector for external clock input
- One SMA connector for clock output

Memory

- DDR3 SO-DIMM SDRAM
- QDRII+ SRAM
- FLASH

Communication Ports

- Four QSFP+ connectors
- PCI Express (PCIe) x8 edge connector
- One RS422 transceiver with RJ45 connector

System Monitor and Control

- Temperature sensor
- Fan control
- Power monitor

Power

- PCI Express 6-pin power connector, 12V DC Input
- PCI Express edge connector power

■ Mechanical Specification

• PCI Express full-height and 3/4-length

1.3 Block Diagram

Figure 1-1 shows the block diagram of the DE5a-Net board. To provide maximum flexibility for the users, all key components are connected with the Arria 10 GX FPGA device. Thus, users can configure the FPGA to implement any system design.

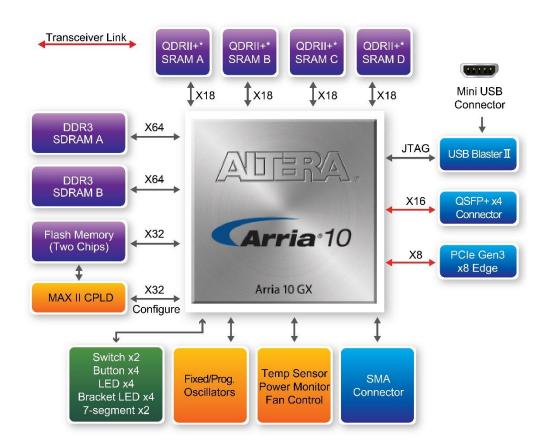

Figure 1-1 Block diagram of the DE5a-Net board

Below is more detailed information regarding the blocks in **Figure 1-1**.

Arria 10 GX FPGA

- 10AX115N3F45I2SG
- 1,150K logic elements (LEs)
- 67-Mbits embedded memory
- 48 transceivers (12.5Gbps)
- 3,036 18-bit x 19-bit multipliers
- 1,518 Variable-precision DSP blocks
- 4 PCI Express hard IP blocks
- 768 user I/Os
- 384 LVDS channels
- 32 phase locked loops (PLLs)

■ JTAG Header and FPGA Configuration

- On-board USB Blaster II or JTAG header for use with the Quartus II Programmer
- MAXII CPLD 5M2210 System Controller and Fast Passive Parallel (FPP x32) configuration

■ Memory devices

- 32MB QDRII+ SRAM
- Up to 8GB DDR3 SO-DIMM SDRAM for each DDR3 socket
- 256MB FLASH

■ General user I/O

- 8 user controllable LEDs
- 4 user push buttons
- 2 user slide switches
- 2 seven-segment displays

On-Board Clock

- 50MHz oscillator
- Programming PLL providing clock for 40G QSFP+ transceiver
- Programming PLL providing clock for PCle transceiver
- Programming PLL providing clocks for DDR3 SDRAM and QDRII+ SRAM

■ Four QSFP+ ports

• Four QSFP+ connector (40 Gbps+)

■ PCI Express x8 edge connector

- Support for PCle x8 Gen1/2/3
- Edge connector for PC motherboard with x8 or x16 PCI Express slot

■ Power Source

- PCI Express 6-pin DC 12V power
- PCI Express edge connector power

Chapter 2

Board Components

his chapter introduces all the important components on the DE5a-Net.

2.1 Board Overview

Figure 2-1 is the top and bottom view of the DE5a-Net development board. It depicts the layout of the board and indicates the location of the connectors and key components. Users can refer to this figure for relative location of the connectors and key components.

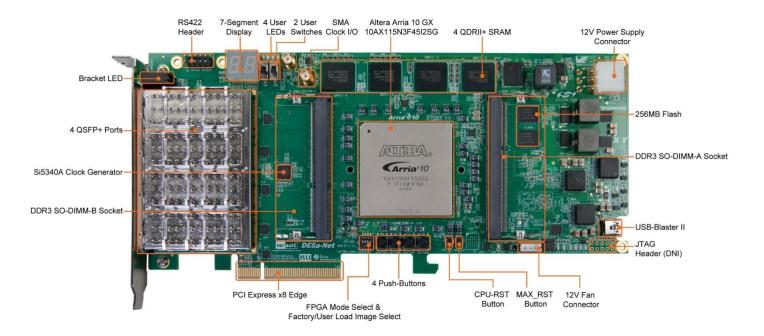

Figure 2-1FPGABoard (Top)

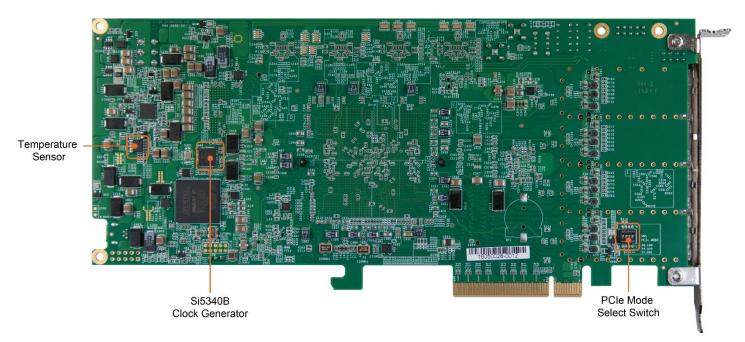

Figure 2-2 FPGA Board (Bottom)

2.2 Configuration, Status and Setup

■ Configure

The FPGA board supports two configuration methods for the Arria 10 FPGA:

- Configure the FPGA using the on-board USB-Blaster II.
- Flash memory configuration of the FPGA using stored images from the flash memory on power-up.

For programming by on-board USB-Blaster II, the following procedures show how to download a configuration bit stream into the Arria 10 GX FPGA:

- Make sure that power is provided to the FPGA board
- Connect your PC to the FPGA board using a mini-USB cable and make sure the USB-Blaster II driver is installed on PC.
- Launch Quartus II programmer and make sure the USB-Blaster II is detected.
- In Quartus II Programmer, add the configuration bit stream file (.sof), check the associated "Program/Configure" item, and click "Start" to start FPGA programming.

■ Status LED

The FPGA Board development board includes board-specific status LEDs to indicate board status. Please refer to **Table 2-1** for the description of the LED indicator.

Table 2-1 Status LED

Board Reference	LED Name	Description
D6	12-V Power	Illuminates when 12-V power is active.
D5	3.3-V Power	Illuminates when 3.3-V power is active.
D16	CONF DONE	Illuminates when the FPGA is successfully configured. Driven by the MAX II CPLD 5M2210 System Controller.
D15	Loading	Illuminates when the MAX II CPLD 5M2210 System Controller is actively configuring the FPGA. Driven by the MAX II CPLD 5M2210 System Controller with the Embedded Blaster CPLD.
D17	Error	Illuminates when the MAX II CPLD EPM2210 System Controller fails to configure the FPGA. Driven by the MAX II CPLD EPM2210 System Controller.
D19	PAGE	Illuminates when FPGA is configured by the factory configuration bit stream.

■ Setup PCI Express Control DIP switch

The PCI Express Control DIP switch (SW5) is provided to enable or disable different configurations of the PCIe Connector. **Table 2-2**lists the switch controls and description.

Table 2-2 SW5 PCIe Control DIP Switch

Board Reference	Signal Name	Description	Default
SW5.1	IPCIE PRSNT2n x1	On: Enable x1 presence detect Off: Disable x1 presence detect	Off
SW5.2	PCIE PRSNT2n x4	On: Enable x4 presence detect Off: Disable x4 presence detect	Off
SW5.3	PCIE_PRSNT2n_x8	On : Enable x8 presence detect	On

Off: Disable x8 presence detect

■ Setup Configure Mode

The position 1~3 of DIP switch SW3 are used to specify the configuration mode of the FPGA. As currently only one mode is supported, please set all positions as shown in **Figure 2-3**.

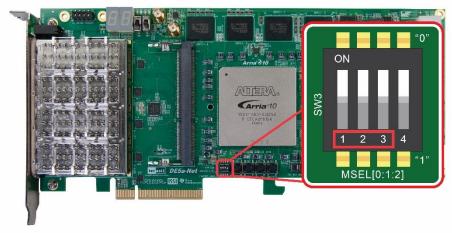

Figure 2-3

Position of DIP switch SW3 for Configure Mode

■ Select Flash Image for Configuration

The position 4 of DIP switch SW3 is used to specify the image for configuration of the FPGA. Setting Position 4 of SW3 to "1" (down position) specifies the default factory image to be loaded, as shown in **Figure 2-4**. Setting Position 4 of SW3 to "0" (up position) specifies the DE5a-Net to load a user-defined image, as shown in **Figure 2-5**.

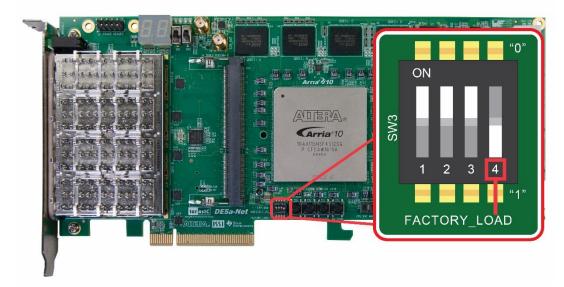

Figure 2-4 Position of DIP switch SW3 for Image Select – Factory Image Load

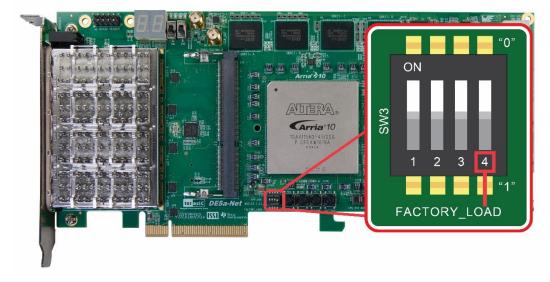

Figure 2-5 Position of DIP switch SW3 for Image Select - User Image Load

2.3 General User Input/Output

This section describes the user I/O interface to the FPGA.

■ User Defined Push-buttons

The FPGA board includes four user defined push-buttons that allow users to interact with the Arria 10 GX device. Each push-button provides a high logic level or a low logic level when it is not pressed or pressed, respectively. **Table 2-3** lists the board

references, signal names and their corresponding Arria 10 GX device pin numbers.

Table 2-3 Push-button Pin Assignments, Schematic Signal Names, and Functions

Board Reference	Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
PB0	BUTTON0		1.5-V	PIN_AJ13
PB1	BUTTON1	High Logic Level when the button	1.5-V	PIN_AE13
PB2	BUTTON2	s not pressed	1.5-V	PIN_AV16
PB3	BUTTON3		1.5-V	PIN_AR9

■ User-Defined Slide Switch

There are two slide switches on the FPGA board to provide additional FPGA input control. When a slide switch is in the DOWN position or the UPPER position, it provides a low logic level or a high logic level to the Arria 10 GX FPGA, respectively, as shown in **Figure 2-6**.

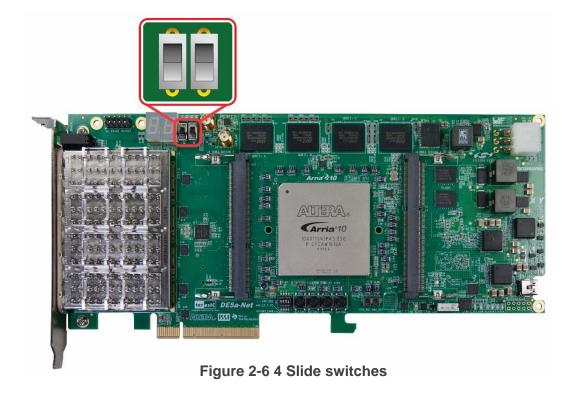

Table 2-4 lists the signal names and their corresponding Arria 10 GX device pin numbers.

Table 2-4 Slide Switch Pin Assignments, Schematic Signal Names, and Functions

Board Reference	Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
SW0	SW0	High logic level when SW in the	1.5-V	PIN_AY28
SW1	SW1	UPPER position.	1.5-V	PIN_AM27

■ User-Defined LEDs

The FPGA board consists of 8 user-controllable LEDs to allow status and debugging signals to be driven to the LEDs from the designs loaded into the Arria 10 GX device. Each LED is driven directly by the Arria 10 GX FPGA. The LED is turned on or off when the associated pins are driven to a low or high logic level, respectively. A list of the pin names on the FPGA that are connected to the LEDs is given in **Table 2-5**.

Table 2-5 User LEDs Pin Assignments, Schematic Signal Names, and Functions

Board	Schematic	Description	I/O	Arria 10 GX Pin
Reference	Signal Name	Description	Standard	Number
D4	LED0		1.8-V	PIN_T11
D3	LED1		1.8-V	PIN_R11
D2	LED2	Driving a logic 0 on the I/O	1.8-V	PIN_N15
D1	LED3	port turns the LED ON.	1.8-V	PIN_M15
D9-1	LED_BRACKET0	Driving a logic 1 on the I/O	1.8-V	PIN_AF10
D9-3	LED_BRACKET1	port turns the LED OFF.	1.8-V	PIN_AF9
D9-5	LED_BRACKET2		1.8-V	PIN_Y13
D9-7	LED_BRACKET3		1.8-V	PIN_W11

■ 7-Segment Displays

The FPGA board has two 7-segment displays. As indicated in the schematic in **Figure 2-7**, the seven segments are connected to pins of the Arria 10 GX FPGA. Applying a low or high logic level to a segment will turn it on or turn it off, respectively.

Each segment in a display is identified by an index listed from 0 to 6 with the positions given in **Figure 2-8**. In addition, the decimal point is identified as DP. **Table 2-6** shows the mapping of the FPGA pin assignments to the 7-segment displays.

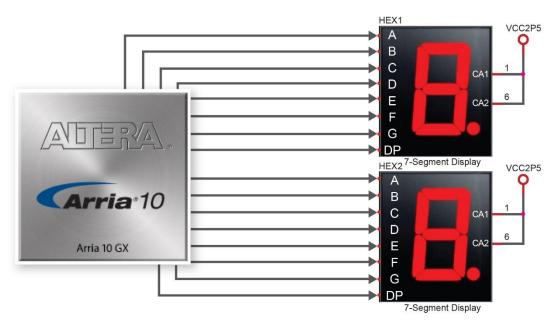

Figure 2-7 Connection between 7-segment displays and Arria 10 GX FPGA

Figure 2-8 Position and index of each segment in a 7-segment display

Table 2-6 User LEDs Pin Assignments, Schematic Signal Names, and Functions

Board Reference	Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
HEX1	HEX1_D0		1.5-V	PIN_AM33
HEX1	HEX1_D1		1.5-V	PIN_AN33
HEX1	HEX1_D2		1.5-V	PIN_AM32
HEX1	HEX1_D3	User-Defined 7-Segment Display. Driving logic 0 on the I/O port turns the 7-segment signal ON. Driving logic 1 on the I/O port turns the	1.5-V	PIN_AN32
HEX1	HEX1 D4		1.5-V	PIN_AN31
HEX1	HEX1_D5		1.5-V	PIN_AP31
HEX1	HEX1_D6	7-segment signal OFF.	1.5-V	PIN_AK32
HEX1	HEX1_DP	7-3cgment signal of 1.	1.5-V	PIN_AK31
HEX0	HEX0_D0		1.5-V	PIN_AV10
HEX0	HEX0_D1		1.5-V	PIN_AV11
HEX0	HEX0_D2		1.5-V	PIN_AW8

HEX0	HEX0_D3	1.5-V	PIN_AY
HEX0	HEX0_D4	1.5-V	PIN_AY
HEX0	HEX0_D5	1.5-V	PIN_BA
HEX0	HEX0_D6	1.5-V	PIN_AW
HEX0	HEX0_DP	1.5-V	PIN_AW

2.4 Temperature Sensor and Fan Control

The FPGA board is equipped with a temperature sensor, MAX1619, which provides temperature sensing and over-temperature alert. These functions are accomplished by connecting the temperature sensor to the internal temperature sensing diode of the Arria 10 GX device. The temperature status and alarm threshold registers of the temperature sensor can be programmed by a two-wire SMBus, which is connected to the Arria 10 GX FPGA. In addition, the 7-bit POR slave address for this sensor is set to '0011000b'. Figure 2-9 shows the connection between the temperature sensor and the Arria 10 GX FPGA.

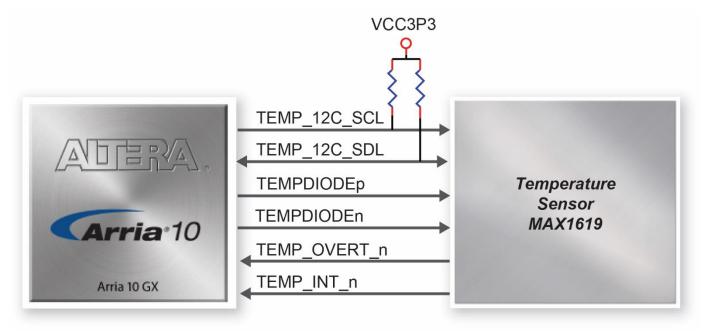

Figure 2-9 Connections between the temperature sensor and the Arria 10 GX FPGA

An optional 3-pin +12V fan located on J15 of the FPGA board is intended to reduce the temperature of the FPGA. The board is equipped with a Fan-Speed regulator and monitor, MAX6650, through an I2C interface, Users regulate and monitor the speed of fan depending on the measured system temperature.

Figure2-10showstheconnectionbetweenthe Fan-Speed Regulator and Monitor and the Arria 10 GX FPGA.

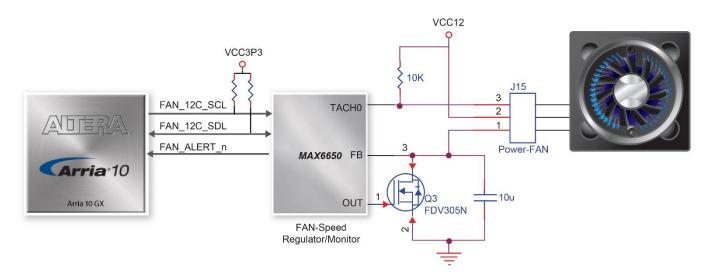

Figure 2-10 Connections between the Fan-Speed Regulator/ Monitor and the Arria 10 GX FPGA

The pin assignments for the associated interface are listed in **Table 2-7**.

Table 2-1Temperature Sensor and Fan Speed Control Pin Assignments, Schematic Signal Names, and Functions

Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
TEMPDIODEp	Positive pin of temperature diode in Arria 10	-	PIN_N21
TEMPDIODEn	Negative pin of temperature diode in Arria 10	-	PIN_P21
TEMP_I2C_SCL	SMBus clock	1.5-V	PIN_AU12
TEMP_I2C_SDA	SMBus data	1.5-V	PIN_AV12
TEMP_OVERT_n	SMBus alert (interrupt)	1.5-V	PIN_AW11

TEMP_INT_n	SMBus alert (interrupt)	1.5-V	PIN_AY12
FAN_I2C_SCL	2-Wire Serial Clock	1.5-V	PIN_AJ33
FAN_I2C_SDA	2-Wire Serial-Data	1.5-V	PIN_AK33
FAN_ALERT_n	Active-low AL ERT input	1.5-V	PIN_AL32

2.5 Power Monitor

The DE5a-Net has implemented a power monitor chip to monitor the board input power voltage and current. **Figure 2-11** shows the connection between the power monitor chip and the Arria 10 GX FPGA. The power monitor chip monitors both shunt voltage drops and board input power voltage allows user to monitor the total board power consumption. Programmable calibration value, conversion times, and averaging, combined with an internal multiplier, enable direct readouts of current in amperes and power in watts. Table 2-8 shows the pin assignment of power monitor I2C bus.

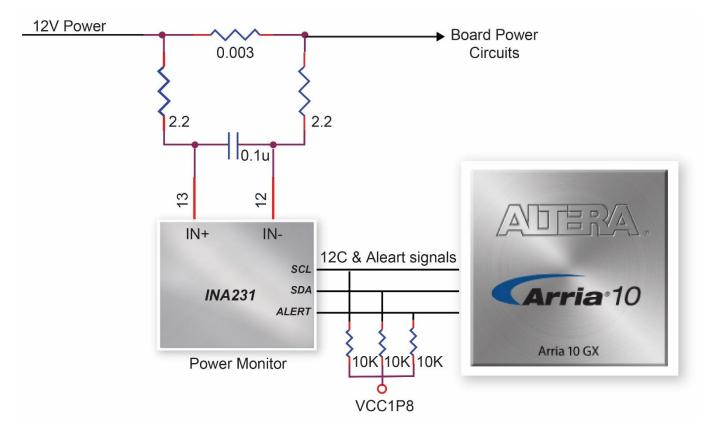

Figure 2-11 Connections between the Power Monitor chip and the Arria 10 GX FPGA

Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
POWER_MONITOR_I2C_SCL	Power Monitor SCL	1.8V	PIN_AT26
POWER_MONITOR_I2C_SDA	Power Monitor SDA	1.8V	PIN_AP25
POWER_MONITOR_ALERT	Power Monitor ALERT	1.8V	PIN_BD23

2.6 Clock Circuit

The development board includes one 50 MHz and two programmable clock generators. **Figure 2-12** shows the default frequencies of on-board all external clocks going to the Arria 10 GX FPGA.

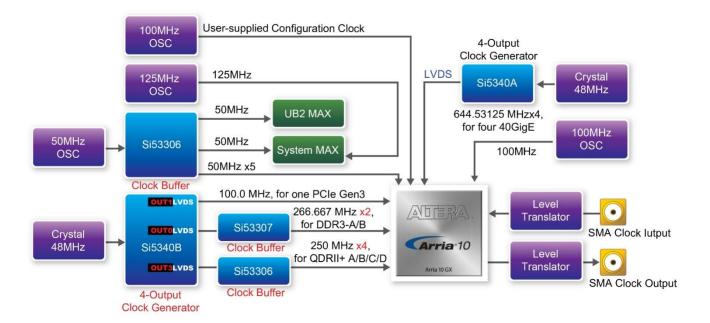

Figure 2-12 Clock circuit of the FPGA Board

A clock buffer is used to duplicate the 50 MHz oscillator, so there are five 50MHz clocks fed into different five FPGA banks. The two programming clock generators are low-jitter oscillators which are used to provide special and high quality clock signals for high-speed transceivers and high bandwidth memory. Through I2C serial interface, the clock generator controllers in the Arria 10 GX FPGA can be used to program the Si5340A and Si5340B to generate 40G Ethernet QSFP+, PCIe and high bandwidth memory reference clocks respectively. Two SMA connectors provide external clock input and clock output respectively.

Table2-9 lists the clock source, signal names, default frequency and their corresponding Arria 10 GX device pin numbers.

Table 2-9 Clock Source, Signal Name, Default Frequency, Pin Assignments and Functions

Carmaa	Schematic	Default	I/O	Arria 10 GX	Amuliantian
Source	Signal Name	Frequency	Standard	Pin Number	Application
	CLK_50_B2J		1.8V	PIN_W36

2.7 FLASH Memory

The development board has two 1Gb CFI-compatible synchronous flash devices for non-volatile storage of FPGA configuration data, user application data, and user code space.

Each interface has a 16-bit data bus and the two devices combined allow for FPP x32 configuration. This device is part of the shared flash and MAX (FM) bus, which connects to the flash memory and MAX V CPLD (5M2210) System Controller. **Figure 2-13** shows the connections between the Flash, MAX and Arria 10 GX FPGA.

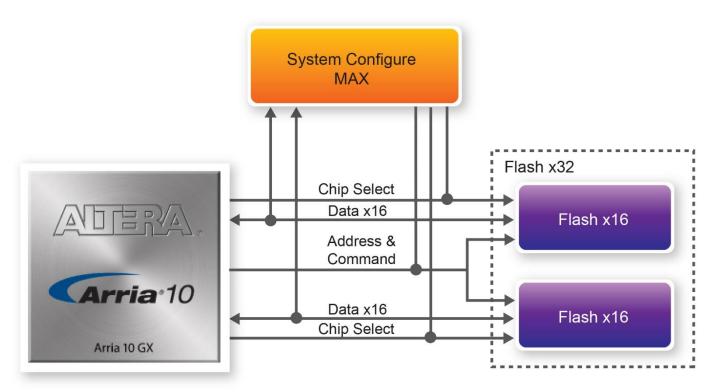

Figure 2-13 Connection between the Flash, Max and Arria 10 GX FPGA

Table 2-11 lists the flash pin assignments, signal names, and functions.

Table 2-11 Flash Memory Pin Assignments, Schematic Signal Names, and Functions

2.8 DDR3 SO-DIMM

The development board supports two independent banks of DDR3 SDRAM SO-DIMM. Each DDR3 SODIMM socket is wired to support a maximum capacity of 8GB with a 64-bit data bus. Using differential DQS signaling for the DDR3 SDRAM interfaces, it is capable of running at up to 933MHz memory clock for a maximum theoretical

bandwidth up to 95.4Gbps. **Figure 2-14** shows the connections between the DDR3 SDRAM SO-DIMMs and Arria 10 GX FPGA.

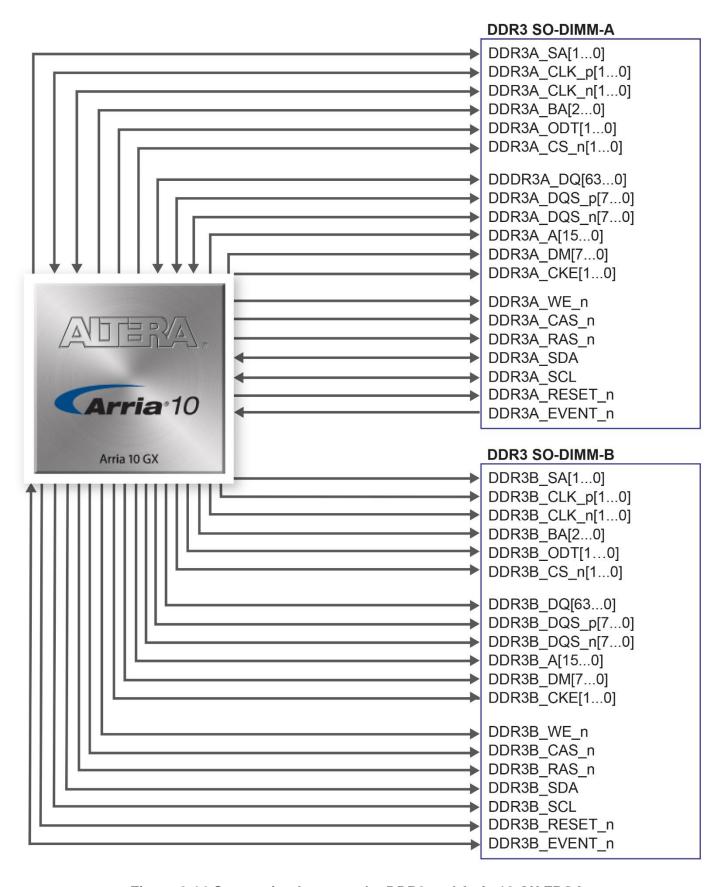

Figure 2-14 Connection between the DDR3 and Arria 10 GX FPGA

The pin assignments for DDR3 SDRAM SO-DIMM Bank-A and Bank-B are listed in **Table 2-12** and **Table 2-13**, in respectively.

Table 2-12 DDR3-A Bank Pin Assignments, Schematic Signal Names, and Functions

2.9 QDRII+ SRAM

The development board supports four independent QDRII+ SRAM memory devices for very-high speed and low-latency memory access. Each of QDRII+ has a x18 interface, providing addressing to a device of up to a 8MB (not including parity bits). The QDRII+ has separate read and write data ports with DDR signaling at up to 550 MHz.

Table 2-14, **Table 2-15**, **Table 2-16** and **Table 2-17** lists the QDRII+ SRAM Bank A, B, C and D pin assignments, signal names relative to the Arria 10 GX device, in respectively.

Table 2-14 QDRII+ SRAM A Pin Assignments, Schematic Signal Names, and Functions

Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
QDRIIA_A0	Address bus[0]	1.8-V HSTL Class I	PIN_V12
QDRIIA_A1	Address bus[1]	1.8-V HSTL Class I	PIN_V13
QDRIIA_A2	Address bus[2]	1.8-V HSTL Class I	PIN_N10
QDRIIA_A3	Address bus[3]	1.8-V HSTL Class I	PIN_M10
QDRIIA_A4	Address bus[4]	1.8-V HSTL Class I	PIN_P11
QDRIIA_A5	Address bus[5]	1.8-V HSTL Class I	PIN_N11
QDRIIA_A6	Address bus[6]	1.8-V HSTL Class I	PIN_M9
QDRIIA_A7	Address bus[7]	1.8-V HSTL Class I	PIN_M8
QDRIIA_A8	Address bus[8]	1.8-V HSTL Class I	PIN_N7

2.10 QSPF+ Ports

The development board has four independent 40G QSFP+ connectors that use one transceiver channel each from the Arria 10 GX FPGA device. These modules take in serial data from the Arria 10 GX FPGA device and transform them to optical signals. The board includes cage assemblies for the QSFP+ connectors. **Figure 2-15** shows the connections between the QSFP+ and Arria 10 GX FPGA.

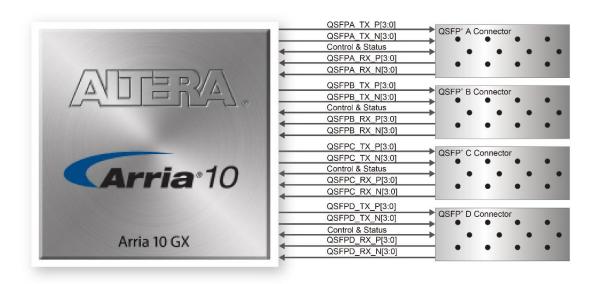

Figure 2-15 Connection between the QSFP+ and Arria GX FPGA

Table 2-18, **Table 2-19**, **Table 2-20** and **Table 2-21** list the QSFP+ A, B, C and D pin assignments and signal names relative to the Arria 10 GX device.

Table 2-18 QSFP+ A Pin Assignments, Schematic Signal Names, and Functions

Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
QSFPA_TX_P0	Transmitter data of channel 0	1.4-V PCML	PIN_BD5

2.11 PCI Express

or x16 PCI Express slot. Utilizing built-in transceivers on a Arria 10 GX device, it is able to provide a fully integrated PCI Express-compliant solution for multi-lane (x1, x4, and x8) applications. With the PCI Express hard IP block incorporated in the Arria 10 GX device, it will allow users to implement simple and fast protocol, as well as saving logic resources for logic application. **Figure2-16** presents the pin connection established between the Arria 10 GX and PCI Express.

The PCI Express interface supports complete PCI Express Gen1 at 2.5Gbps/lane, Gen2 at 5.0Gbps/lane, and Gen3 at 8.0Gbps/lane protocol stack solution compliant to PCI Express base specification 3.0 that includes PHY-MAC, Data Link, and transaction layer circuitry embedded in PCI Express hard IP blocks.

Please note that it is a requirement that you connect the PCIe external power connector to 6-pin 12V DC power connector in the FPGA to avoid FPGA damage due to insufficient power. The PCIE_REFCLK_p signal is a differential input that is driven from the PC motherboard on this board through the PCIe edge connector. A DIP switch (SW5) is connected to the PCI Express to allow different configurations to enable a x1, x4, or x8 PCIe.

Table 2-22 summarizes the PCI Express pin assignments of the signal names relative to the Arria 10 GX FPGA.

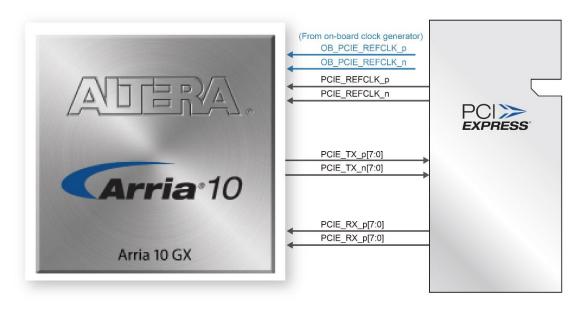

Figure 2-16 PCI Express pin connection

Table 2-22 PCI Express Pin Assignments, Schematic Signal Names, and Functions

Schematic Signal Name	Description	I/O Standard	Arria 10 GX Pin Number
PCIE_TX_p0	Add-in card transmit bus	1.4-V PCML	PIN_AV44
PCIE_TX_n0	Add-in card transmit bus	1.4-V PCML	PIN_AV43

2-12 RS-422 Expansion Header

The 2x5 RS-422 expansion header is designed to perform communication between boards. Users can use Terasic defined RS422-RJ45 board to translate RS-422 signal, allowing a transmission speed of up to 26 Mbps. Figure 2-17 shows the RS-422 application diagram. Table 2-23lists the RS-422 pin assignments, signal names and functions.

Chapter 3

System Builder

his chapter describes how users can create a custom design project for the FPGA board from a software tool named System Builder.

3.1 Introduction

The System Builder is a Windows based software utility. It is designed to help users create a Quartus II project for the FPGA board within minutes. The Quartus II project files generated include:

- Quartus II Project File (.qpf)
- Quartus II Setting File (.qsf)
- Top-Level Design File (.v)
- External PLL Controller (.v)
- Synopsis Design Constraints file (.sdc)
- Pin Assignment Document (.htm)

The System Builder not only can generate the files above, but can also provide error-checking rules to handle situation that are prone to errors. The common mistakes that users encounter are the following:

- Board damaged for wrong pin/bank voltage assignment.
- Board malfunction caused by wrong device connections or missing pin counts for connected ends.
- Performance dropped because of improper pin assignments

3.2 General Design Flow

This section will introduce the general design flow to build a project for the FPGA board via the System Builder. The general design flow is illustrated in the **Figure 3-1**.

Users should launch System Builder and create a new project according to their design requirements. When users complete the settings, the System Builder will generate two major files which include top-level design file (.v) and the Quartus II setting file (.qsf).

The top-level design file contains top-level Verilog wrapper for users to add their own design/logic. The Quartus II setting file contains information such as FPGA device type, top-level pin assignment, and I/O standard for each user-defined I/O pin.

Finally, Quartus II programmer must be used to download SOF file to the FPGA board using JTAG interface.

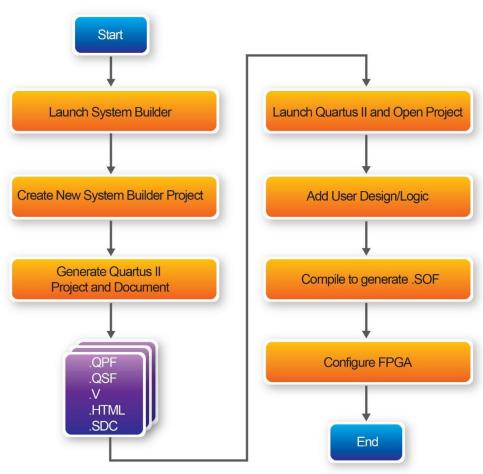

Figure 3-1Thegeneral design flow of building a project

3.3 Using System Builder

This section provides the detail procedures on how the System Builder is used.

Install and Launch the System Builder

The System Builder is located under the directory: "Tools\SystemBuilder" in the System CD. Users can copy the entire folder to the host computer without installing the utility. Please execute the SystemBuilder.exe on the host computer, as shown in Figure 3-2.

Figure 3-1The System Builder window

■ Enter Project Name

The project name entered in the circled area as shown in **Figure 3-3**, will be assigned automatically as the name of the top-level design entry.

Figure 3-2The Quartusproject name

System Configuration

Users are given the flexibility of enabling their choices of components connected to the FPGA under System Configuration, as shown in **Figure 3-4**. Each component of the FPGA board is listed to be enabled or disabled according to users' needs. If a component is enabled, the System Builder will automatically generate the associated pin assignments including its pin name, pin location, pin direction, and I/O standards.

Note: The pin assignments for some components (e.g. DDR3 and QSFP+) require associated controller codes in the Quartus project or it would result in compilation error. Hence please do not select them if they are not needed in the design. To use the DDR3 controller, please refer to the DDR3 SDRAM demonstration in Chapter 6.

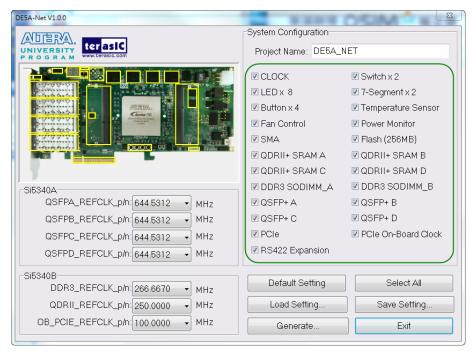

Figure 3-3System Configuration group

■ Programmable Oscillator

There are two external oscillators on-board that provide reference clocks for the following signals

QSFPA_REFCLK,QSFPB_REFCLK,QSFPC_REFCLK,QSFPD_REFCLK,

DDR3_REFCLK, QDRII_REFCLK, and OB_PCIE_REFCLK. To use these clock, users can select the desired frequency on the Programmable Oscillator group, as shown in **Figure 3-5**. QDRII, DDR3, or QSFP+ must be checked before users can start to specify the desired frequency in the programmable oscillators.

As the Quartus project is created, System Builder automatically generates the associated controller according to users' desired frequency in Verilog which facilitates users' implementation as no additional control code is required to configure the programmable oscillator.

Note: If users need to dynamically change the frequency, they would need to modify the generated control code themselves.

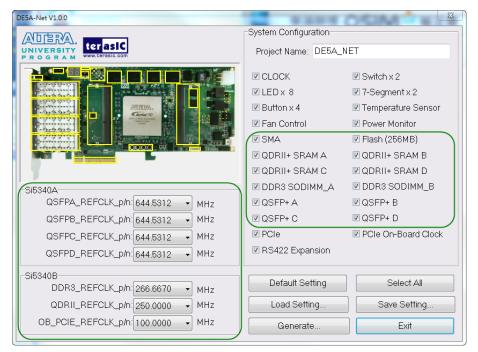

Figure 3-4External programmable oscillators

Project Setting Management

The System Builder also provides functions to restore default setting, load a setting, and save board configuration file, as shown in **Figure 3-6**. Users can save the current board configuration information into a .cfg file and load it into the System Builder.

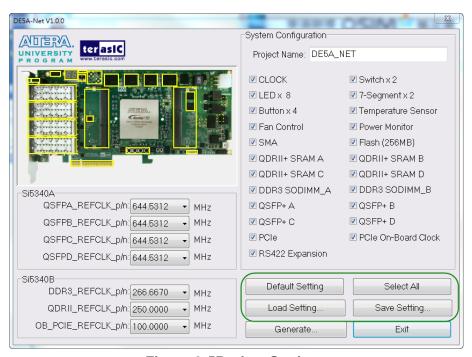

Figure 3-5Project Settings

■ Project Generation

When users press the Generate button, the System Builder will generate the corresponding Quartus II files and documents as listed in the **Table 3-1** in the directory specified by the user.

Table 3-1 Files generated by the System Builder

No.	Filename	Description	
1	<project name="">.v</project>	Top Level Verilog File for Quartus II	
2	Si5340_controller (*)	Si5340A and Si5340BExternal Oscillator Controller IP	
3	<project name="">.qpf</project>	Quartus II Project File	
4	<project name="">.qsf</project>	Quartus II Setting File	
5	<project name="">.sdc</project>	Synopsis Design Constraints File for Quartus II	
6	<project name="">.htm</project>	Pin Assignment Document	

(*) The Si5340_controller is a folder which contains the Verilog files for the configuration of Si5340A and Si5340B.

Users can add custom logic into the project and compile the project in Quartus II to generate the SRAM Object File (.sof).

For Si5340A, its controller will be instantiated in the Quartus II top-level file, as listed below:

```
Configure SI5340A
                                    3'h0
 define SI5340A_POWER_DOWN
                                    3'h1
 define SI5340A_644M53125
                                    3'h2
 define SI5340A_322M265625
                                    3'h3
 define SI5340A_312M5
define SI5340A_250M
                                    3'h4
                                    3'h5
`define SI5340A_156M25
                                     3'h6
 define SI5340A_125M
 define SI5340A_100M
wire si5340a_controller_start;
assign si5340a_controller_start = ~BUTTON[0];
si5340a_controller si5340a_controller(
     .iclk(clk_50_B2J),
     .iRST_n(CPU_RESET_n),
     .iStart(si5340a_controller_start),
     .iPLL_OUTO_FREQ_SEL(`SI5340A_644M53125),//QSFP-A
.iPLL_OUT1_FREQ_SEL(`SI5340A_644M53125),//QSFP-B
.iPLL_OUT2_FREQ_SEL(`SI5340A_644M53125),//QSFP-C
.iPLL_OUT3_FREQ_SEL(`SI5340A_644M53125),//QSFP-D
     .OPLL_I2C_ID_READ_ERROR(),
     .I2C_CLK(5I5340A_I2C_SCL)
     .I2C_DATA(SI5340A_I2C_SDA),
     .oPLL_REG_CONFIG_DONE()
);
assign SI5340A_OE_n = 1'b0;
assign SI5340A_RST_n = CPU_RESET_n;
```

For Si5340B, its controller will be instantiated in the Quartus II top-level file, as listed below:

```
Configure SI5340B
                                          4'h0
4'h1
 define DDR266_QDR275_PCIE100
define DDR233_QDR275_PCIE100
define DDR200_QDR275_PCIE100
                                          4 h2
define DDR266_QDR250_PCIE100
                                          4'h3
define DDR233_QDR250_PCIE100
                                          4 h4
define DDR200_QDR250_PCIE100
define DDR266_QDR225_PCIE100
define DDR233_QDR225_PCIE100
define DDR200_QDR225_PCIE100
                                          4'h6
                                          4 'h8
4 'h9
define DDR266_QDR233_PCIE100
 define DDR233_QDR233_PCIE100
`define DDR200_QDR233_PCIE100
wire si5340b_controller_start;
wire config_done;
assign si5340b_controller_start = ~BUTTON[0];
si5340b_controller si5340b_controller(
     .icLK(CLK_50_B2J),
     .iRST_n(CPU_RESET_n)
    .istart(si5340b_controller_start),
.ipLL_OUT_FREQ_SEL(`DDR266_QDR233_PCIE100),
.I2C_CLK(SI5340B_I2C_SCL),
.I2C_DATA(SI5340B_I2C_SDA),
     .oPLL_REG_CONFIG_DONE(config_done)
assign SI5340B_OE_n = 1'b0;
assign SI5340B_RST_n = CPU_RESET_n;
```

If the dynamic configuration for the oscillatoris required, users need to modify the code according to users' desired behavior.

Chapter 4

Flash Programming

s you develop your own project using the Altera tools, you can program the flash memory device so that your own design loads from flash memory into the FPGA on power up. This chapter will describe how to use Altera Quartus II Programmer Tool to program the common flash interface (CFI) flash memory device on the FPGA board. The Arria X GX FPGA development board ships with the CFI flash device preprogrammed with a default factory FPGA configuration for running the Parallel Flash Loader design example.

4.1 CFI Flash Memory Map

Table 4-1shows the default memory contents of two interlaced 1Gb (128MB) CFI flash device. Each flash device has a 16-bit data bus and the two combined flash devices allow for a 32-bit flash memory interface. For the factory default code to run correctly and update designs in the user memory, this memory map must not be altered.

Table 4-1Flash Memory Map (Byte Address)

Block Description	Size(KB)	Address Range
PFL option bits	64	0x00030000 - 0x0003FFFF
Factory hardware	44,032	0x00040000 - 0x02B3FFFF
User hardware	44,032	0x02B40000 - 0x0563FFFF
Factory software	8,192	0x05640000 - 0x05E3FFFF
User software and data	165,632	0x05E40000 - 0x0FFFFFF

For user application, user hardware must be stored with start address 0x02B40000, and the user's software is suggested to be stored with start address 0x05E40000. The NIOS II EDS tool nios-2-flash-programmer is used for programming the flash. Before programming, users need to translate their Quartus .sof and NIOS II .elf files into the .flash which is used by the nios-2-flash-programmer. For .sof to .flash translation, NIOS II EDS tool sof2flsh can be used. For the .elf to .flash translation, NIOS II EDS tool elf2flash can be used. For convenience, the System CD contains a batch file for

file translation and flash programming with users given .sof and .elf file.

4.2 FPGA Configure Operation

Here is the procedure to enable FPGA configuration from Flash:

- 1. Please make sure the FPGA configuration data has been stored in the CFI flash.
- 2. Set the FPGA configuration mode to FPPx32 mode by setting SW3 MSEL[0:2] as 000 as shown in **Figure 4-1**.
- Specify the configuration of the FPGA using the default Factory Configuration or User Configuration by setting SW4 according to Figure 4-2.
- 4. Power on the FPGA board or press MAX_RST button if board is already powered
- 5. When configuration is completed, the green Configure Done LED will light. If there is error, the red Configure Error LED will light.

Figure 4-1SW3 MSEL[0:2]=000

4-2Configuration Image Selection

4.3 Flash Programming with Users Design

Users can program the flash memory device so that a custom design loads from flash memory into the FPGA on power up. For convenience, the translation and programming batch files are available on the following folder in the System CD.

Demonstrations/Hello/flash_programming_batch

There folder contains five files as shown in Table 4-2

DE5a NET.sof

HELLO_NIOS.elf

Files NameDescriptionDE5a_NET_PFL.sofParallel Flash Loader Designflash_program.batTop batch file to download DE5a_NET_PFL.sof and launch batch flash_program.shflash_program.shTranslate .sof and .elf into .flash and programming flash with the generated .flash file

Hardware design file for Hello Demo

Software design file for Hello Demo

Table 4-1Content of flash_programming_batch folder

To apply the batch file to users'.sof and .elf file, users can change the.sof and .elf filename in the flash_program.sh file as shown in **Figure 4-3**.

```
sof2flash --input=DE5a_NET.sof -output=flash_hw.flash --offset=0x02B40000 --pfl --opti
elf2flash --base=0x0 --end=0x0FFFFFFF --reset=0x05E40000 --input=HELLO_NIOS.elf --output
```

Figure 4-3 Change to usrs'.sof and .elf filename

If your design does not contain a NIOS II processor, users can add "#" to comment (disable) the elf2flash and nios-flash-programmer commands (marked with green lines as below) in the flash_program.sh file as shown in **Figure 4-4**.

```
#conver to .flash as factory image
"$SOPC_KIT_NIOS2/nios2_command_shell.sh" sof2flash --input=DE5a_NET.sof --output=flash_hw.flash --o
"$SOPC_KIT_NIOS2/nios2_command_shell.sh" elf2flash --base=0x0 --end=0x0FFFFFFF --reset=0x05E40000 -

#Programming with .flash
"$SOPC_KIT_NIOS2/nios2_command_shell.sh" nios2-flash-programmer --base=0x0 flash_hw.flash
"$SOPC_KIT_NIOS2/nios2_command_shell.sh" nios2-flash-programmer --base=0x0 flash_sw.flash
```

Figure 4-4 Disable .elf translation and programming

If your design includes a NIOS II processor and the NIOS II program is stored on

external memory, users must to perform following items so the NIOS II program can be boot from flash successfully:

- 1. QSYS should include a Flash controller for the CFI Flash on the development board. Please ensure that the base address of the controller is 0x00, as shown in **Figure 4-5**.
- 2. In NIOS II processor options, select FLASH as reset vector memory and specify 0x05E40000 as reset vector, as shown in **Figure 4-6**.

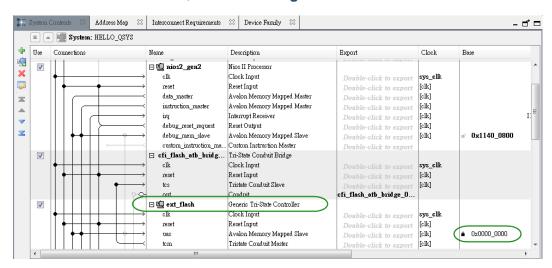

Figure 4-5 Flash Controller Settings in QSYS

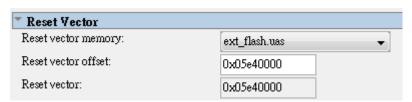

Figure 4-6 Reset Vector Settings for NIOS II Processor

For implementation detail, users can refer the Hello example located in the CD folder: Demonstrations/ Hello

4.4 Restore Factory Settings

This section describes how to restore the original factory contents to the flash memory device on the FPGA development board. Perform the following instructions:

- 1. Make sure the Nios II EDS and USB-Blaster II driver are installed.
- 2. Make sure the FPGA board and PC are connected with an UBS Cable.

- 3. Power on the FPGA board.
- 4. Copy the "Demonstrations/PFL/flash_programming_batch" folder under the CD to your PC's local drive.
- 5. Execute the batch file flash_program.bat to start flash programming.
- 6. Power off the FPGA Board.
- 7. Set FPGA configure mode as FPPx32 Mode by setting SW3 MSEL[0:2] to 000.
- 8. Specify configuration of the FPGA to Factory Hardware by setting the FACTORY LOAD dip in SW4 to the '1' position.
- 9. Power on the FPGA Board, and the Configure Done LED should light.

Except for programming the Flash with the default code PFL, the batch file also writes PFL (Parallel Flash Loader) Option Bits data into the address 0x30000. The option bits data specifies 0x2B40000 as start address of your hardware design.

The NIOS II EDS tool nios-2-flash-programmer programs the Flash based on the Parallel Flasher Loader design in the FPGA. The Parallel Flash Loader design is included in the default code PFL and the source code is available in the folder Demonstrations/ PFL in System CD.

Chapter 5

Peripheral Reference Design

his chapter introduces DE5a-NET peripheral interface reference designs. It mainly introduces Si5340 chip which is a programmable clock generator. We provide two ways (Pure RTL IP and NIOS/Qsys System) respectively to show how to control Si5340 to output desired frequencies, as well as how to control the fan speed. The source codes and tool of these examples are all available on the System CD.

5.1 Configure Si5340A/B in RTL

There are two Silicon Labs Si5340 clock generators on DE5a-net FPGA board can provide adjustable frequency reference clock (See **Figure 5-1**) for QSFP, QDRII , DDR3 and PCIe interfaces, etc. Each Si5340 clock generator can output four groups differential frequencies from 100Hz ~ 712.5Mhz though I2C interface configuration. This chapter will show you how to use FPGA RTL IP to configure each Si5340 PLL and generate users desired output frequency to each peripheral. In the following instruction, the two Si5340 chips will be named as Si5340A and Si5340B respectively.

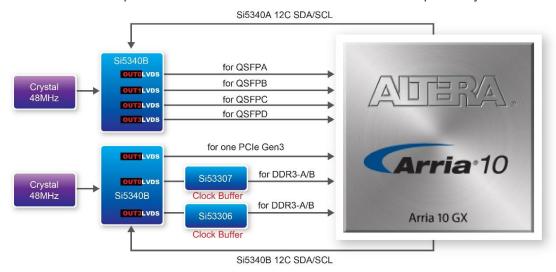

Figure 5-1 Si570 Block diagram

■ Creating Si5340 Control IP

The Si5340 control IP is located in the folder: "\Demonstrations\si5340_control_ip" in the System CD. Also, System Builder tool (locate in System CD) can be used to help users to set Si5340 to output desired frequencies, and generate a Quartus project with control IP. In System Builder window, when checking the boxes of SFP, QDRII, DDR3 and PCle interfaces, Si5340 corresponding output channels will become available and users can select desired frequencies. For example, when checking QSFP+ A box (See Figure 5-2), SI5340A QSFPA_REFCLK_P/N can provide six frequencies from 100Mhz to 644.5312Mhz for users selecting.

As shown in **Figure 5-3**, if all the receiving Si5340 reference clock interface boxes are checked, then, every frequency channel of the two Si5340 chips is controllable by users.

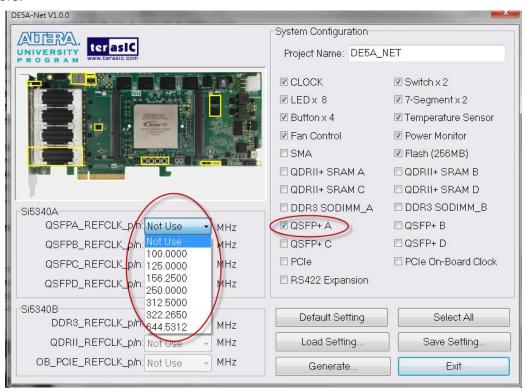

Figure 5-2 Enable Si5340A clock on System Builder

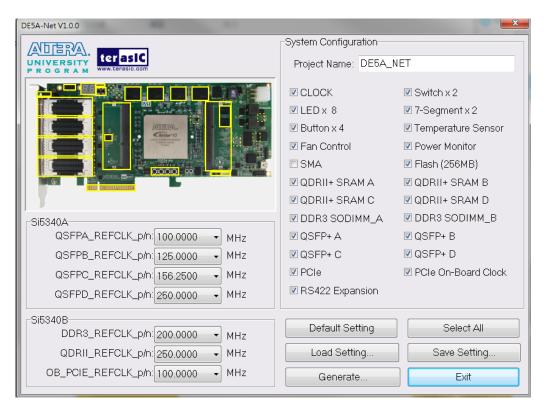

Figure 5-3 Enable Si5340A and Si5340BB clock on System Builder

Click "Generate" button, then, open the Quartus Project generated by System Builder, the control IPs for Si5340A and Si5340B can be found in the top level file.

```
// Configure SI5340A

```

If the output frequency doesn't need to be modified, users can just add their own User Logic and compile it, and then, Si5340 can output desired frequencies. At the same time, System Builder will set Clock constrain according user's preset frequency in a

SDC file (as shown in Figure 5-4).

```
# This .sdc file is created by Terasic Tool.
# Users are recommended to modify this file to match users logic.

Figure 5-4 SDC file created by System Builder

■ Using Si5340 control IP

Table 5-1 lists the instruction ports of Si5340 Controller IP.

Description **Port** Direction **iCLK** System Clock (50Mhz) input Synchronous Reset (0: Module iRST_n input Reset, 1: Normal) Start to Configure (positive edge iStart input trigger) Setting Si5340 Output Channel iPLL_OUTX_FREQ_SEL input Frequency Value Si5340 Configuration status (0: Configuration in Progress, 1: oPLL REG CONFIG DONE output Configuration Complete) I2C DATA inout I2C Serial Data to/fromSi5340 I2C_CLK output I2C Serial Clock to Si5340

Table 5-1 Si5340 Controller Instruction Ports

As shown in Table 5-2 and Table 5-3, both two Si5340 control IPs have preset several

output frequency parameters, if users want to change frequency, users can fill in the input port " iPLL_OUTX_FREQ_SEL" with a desired frequency value and recompile the project. For example, in Si5340A control IP, change

.iPLL_OUT1_FREQ_SEL(`SI5340A_125M), to .iPLL_OUT1_FREQ_SEL(`SI5340A_156M25),

Recompile project, the Si5340A OUT2 channel (for QSFP-C) output frequency will change from 125Mhz to 156.25Mhz.

Table 5-2 Si5340A Controller Frequency Setting

iPLL_OUTX_FREQ_SEL MODE Setting	Si5340A Channel Clock Frequency(MHz)	
3'b000	Power Down	
3'b001	644.53125	
3'b010	322.26	
3'b011	312.25	
3'b100	250	
3'b101	156.25	
3'b110	125	
3'b111	100	

Table 5-3 Si5340B Controller Frequency Setting

iPLL_OUT_FRE Q_SEL MODE Setting	DDR3	QDRII Frequency(MHz)	PCIE Frequency(MHz)
4'b0000	266	275	100
4'b0001	233	275	100
4'b0010	200	275	100
4'b0011	266	250	100
4'b0100	233	250	100
4'b0101	200	250	100
4'b0110	266	225	100
4'b0111	233	225	100
4'b1000	200	225	100
4'b1001	266	233.333	100

4'b1010	233	233.333	100
4'b1011	200	233.333	100

Users can also dynamically modify the input parameters, and input a positive edge trigger for "iStart", then, Si5340 output frequency can be modified.

After the manually modifying, please remember to modify the corresponding frequency value in SDC file.

■ Modify Clock Parameter For Your Own Frequency

If the Si5340 control IP build-in frequencies are not users' desired, users can refer to below steps to modify control IP register parameter settings to modify the IP to output a desired frequency.

1. Firstly, download ClockBuider Pro Software (See Figure 5-5), which is provided by Silicon Labs. This tool can help users to set the Si5340's output frequency of each channel through the GUI interface, and it will automatically calculate the Register parameters required for each frequency. The tool download link:

http://www.silabs.com/products/clocksoscillators/pages/timing-software-development-tools.aspx

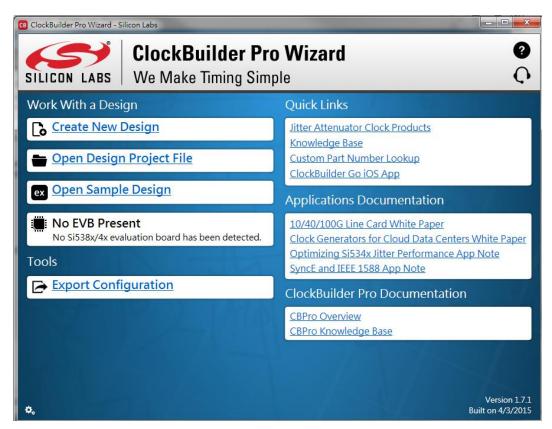

Figure 5-5 ClockBuilder Pro Wizard

2. After the installation, select Si5340, and configure the input frequency and output frequency as shown in **Figure 5-6**.

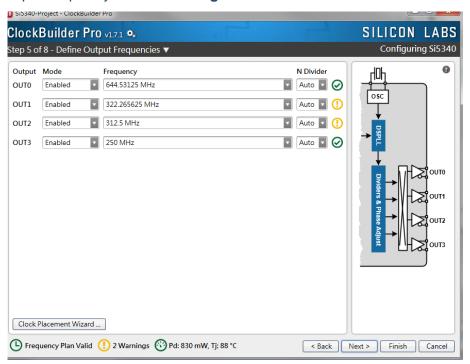

Figure 5-6 Define Output Clock Frequencies on ClockBuilder Pro Wizard

 After the setting is completed, ClockBuider Pro Wizard generates a Design Report(text), which contains users setting frequency corresponding register value (See Figure 5-7).

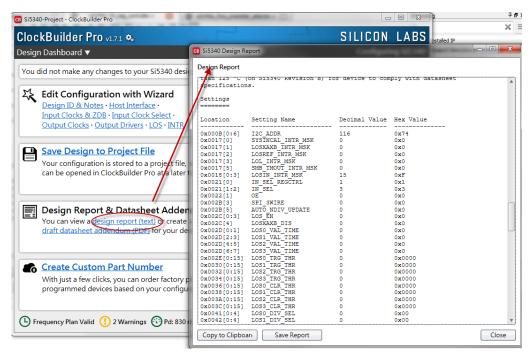

Figure 5-7 Open Design Report on ClockBuilder Pro Wizard

 Open Si5340 control IP sub-module "si5340a_i2c_reg_controller.v" as shown inFigure5-8, refer Design Report parameter to modify sub-module corresponding register value (See Figure 5-9).

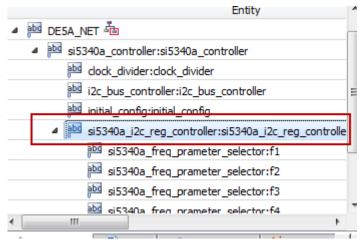

Figure 5-8 Sub-Module file "si5340a i2c reg controller.v"

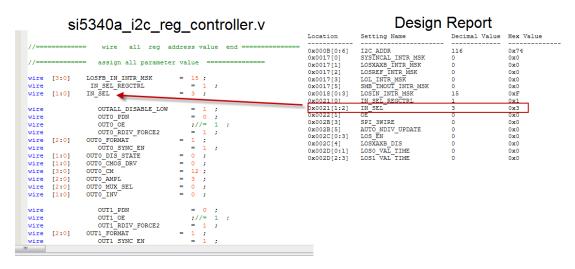

Figure 5-9 Modify Si5340 Control IP Base on Design Report

After modifying and compiling, Si5340 can output new frequencies according to the users' setting.

Note:

- No need to modify all Design Report parameters in si5340a_i2c_reg_controller.v/si5340b_i2c_reg_controller.v, users can ignore parameters which have nothing to do with the frequency setting
- 2. After the manually modifying, please remember to modify clock constrain setting in .SDC file

5.2 Nios II control for

SI5340/Temperature/Power

This demonstration shows how to use the Nios II processor to program two programmable oscillators (Si5340A and Si5340B) on the FPGA board, how to measure the power consumption based on the built-in power measure circuit. The demonstration also includes a function of monitoring system temperature with the on-board temperature sensor.

■ System Block Diagram

Figure 5-10 shows the system block diagram of this demonstration. The system requires a 50 MHz clock provided from the board. The four peripherals (including temperature sensor, Si5340A/B, and INA231) are all controlled by Nios II through the PIO controller, and all of them are programmed through I2C protocol which is implemented in the C code. The I2C pins from chip are connected to Qsys System Interconnect Fabric through PIO controllers. The Nios II program toggles the PIO controller to implement the I2C protocol. The Nios II program is running in the on-chip memory.

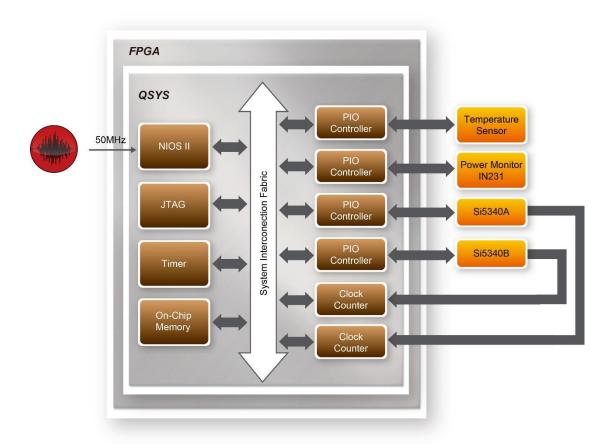

Figure 5-10 Block diagram of the Nios II Basic Demonstration

The program provides a menu in nios-terminal, as shown in **Figure 5-11** to provide an interactive interface. With the menu, users can perform the test for the temperatures sensor, external PLL and power monitor. Note, pressing 'ENTER' should be followed with the choice number.

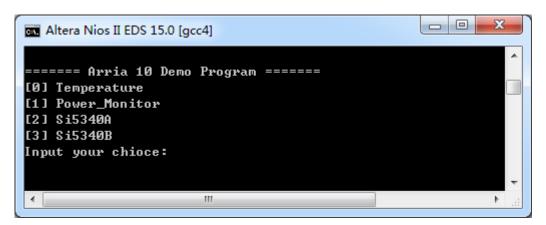

Figure 5-11 Menu of Demo Program

In temperature test, the program will display local temperature and remote temperature. The remote temperature is the FPGA temperature, and the local temperature is the board temperature where the temperature sensor located.

A power monitor IC (INA231AIYFFT) embedded on the board can monitor Arria10 real-time current and power. This IC can work out current/power value as multiplier and divider are embedded in it. There is a shunt resistor R149 (RSHUNT =0.003 Ω) for INA231AIYFFT in the circuit, when power on the DE5a-NET board, there will be a voltage drop (named Shut Voltage) on R149. Based on sense resistors, the program of power monitor can calculate the associated voltage, current and power consumption from the IN231 through the I2C interface. Please note the device I2C address is 0x80.

In the external PLL programming test, the program will program the PLL first, and subsequently will use TERASIC QSYS custom CLOCK_COUNTER IP to count the clock count in a specified period to check whether the output frequency is changed as configured. To avoid a Quartus II compilation error, dummy transceiver controllers are created to receive the clock from the external PLL. Users can ignore the functionality of the transceiver controller in the demonstration. For Si5340A/B programming, Please note the device I2C address are 0xEE. The program can control the Si5340A to configure the output frequency of QSFPA/B/C/D REFCLK, or control the Si5340B to configure the output frequency of DDR3/PCIE/QDRII REFCLK according to your choice.

Demonstration File Locations

- Hardware project directory: NIOS_BASIC_DEMO
- Bitstream used: NIOS_BASIC_DEMO.sof

- Software project directory: NIOS_BASIC_DEMO \software
- Demo batch file: NIOS_BASIC_DEMO\demo_batch\NIOS_BASIC_DEMO.bat, NIOS_BASIC_DEMO.sh

Demonstration Setup and Instructions

- Make sure Quartus II and Nios II are installed on your PC.
- Power on the FPGA board.
- Use the USB Cable to connect your PC and the FPGA board and install USB Blaster II driver if necessary.
- Execute the demo batch file "NIOS_BASIC_DEMO.bat" under the batch file folder,
 NIOS_BASIC_DEMO\demo_batch.
- After the Nios II program is downloaded and executed successfully, a prompt message will be displayed in nios2-terminal.
- For temperature test, please input key '0' and press 'Enter' in the nios-terminal,, as shown in Figure 5-12.
- For power monitor test, please input key '1' and press 'Enter' in the nios-terminal, the Nios II console will display the current values of voltage, current and power as shown in Figure 5-13.
- For programmable PLL Si5340A test, please input key '2' and press 'Enter' in the nios-terminal first, then select the desired output frequency of QSFPA/B/C/C REFCLK, as shown in Figure 5-14.
- For programmable PLL Si5340B test, please input key '3' and press 'Enter' in the nios-terminal first, then select the desired output frequency of DDR3/PCIE/QDRII REFCLK, as shown in Figure 5-15.

Figure 5-15 Si5340B Demo

5.3 Fan Speed Control

This demo helps users quickly understand how to set the MAX6650 chip from the FPGA to control the fansink. The MAX6650 chip can set or retrieve the RPM of the fansink. It can also monitor if there is any unexpected error and determine which type of error it is. The following section will save lots of time for the development of user application.

System Block Diagram

Figure 5-16 shows the system block diagram of this demo. It is necessary to configure the MAX6650 chip prior upon the initialization of fansink control. The MAX6650 chip uses standard I2C protocol for communication. The functions I2C_Config and I2C_Bus_Controller set and monitor the RPM of the fansink, respectively. A pre-scaler is used as frequency divider for the clock frequency of I2C. Users need to calculate the

frequency based on the equations from the datasheet to control the RPM of the fansink. There are three equations in the datasheet and this demo uses one of them. For other equations, please refer to the datasheet MAX6650-MAX6651.pdf in the system CD.

The Switch[0] controls the RPM in this demo. When the Switch[0] is set to 0, the speed is around 2000 RPM. The speed would reach about 5000 RPM if the Switch[0] is set to 1. It would take 10 ~ 30 secs as the buffer time for the conversion. If an error is detected, the LED would lit. Users need to press KEY[1] to reset the LED by turn it off.

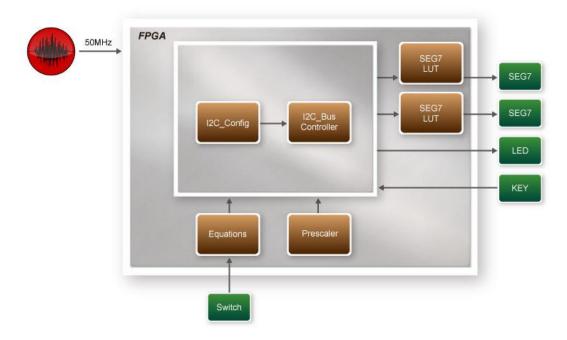

Figure 5-16 Block diagram of the fan speed control demonstration

Alarm Status Register Bit Assignments

When the fan is abnormal, the LED will lit. Users can refer to **Table 5-4** and get a better understanding about the malfunction of the fansink accordingly. The status of BIT $4 \sim 7$ can be ignored because BIT 4 is for MAX6651 only and BIT $5 \sim 7$ are always low.

Table 5-4 Alarm-Enable Resgister Bit Masks

BIT	NAME	POR(DEFAULT)S TATE	FUNCTION
7(MSB) to 5		0	Always 0
4	GPIO2	0	GPIO2 Alarm. Set when GPIO2
4	(MAX6651 only)	U	is low (MAX6651 only)
3(LED[3])	GPIO1	0	GPIO1 Alarm. Set when GPIO1
			is low
2(LED[2])	TACH	0	Tachometer Overflow Alarm
1(LED[1])	MIN	0	Minimum Output Level Alarm
0(LED[0])	MAX	0	Maximum Output Level Alarm

Design Tools

- 64-bit Quartus II v15.1
- Demonstration Source Code
- Project Directory: Demonstration\Fan
- Bit Stream: DE5a_NET_golden_top.sof
- Demonstration Batch File

Demo Batch File Folder: \Fan\demo_batch

The demo batch file includes following files:

Batch File: test_ub2.bat

FPGA Configure File: DE5a_NET_folden_top.sof

■ Demonstration Setup

- Make sure Quartus II is installed on the host PC.
- Connect the DE5a-Net and the host PC via USB cable. Install the USB-Blaster II driver if necessary.
- Power on the FPGA Board.
- Execute the demo batch file "test_ub2.bat" under the batch file folder \Fan\demo_batch.
- When SW[0] is set to 0, the RPM would slowly be adjusted to ~2000. When SW[0] is set to 1, the RPM would slowly be adjusted to ~5000.

Chapter 6

Memory Reference Design

he FPGA development board includes two kinds of high-speed memories:

- DDR3 SDRAM: two independent banks, update to 1066 MHz
- QDRII+ SRAM: four independent banks, update to 550 MHz

This chapter will show three examples which use the Altera Memory IP to perform memory test functions. The source codes of these examples are all available on the FPGA System CD. These three examples are:

- QDRII+ SRAM Test: Full test of the four banks of QDRII+ SRAM
- DD3 SDRAM Test: Random test of the two banks of DDR3 SDRAM.
- DDR3 SDRAM Test by Nios II: Full test of one bank of DDR3 SDRAM with Nios II

Note. 64-Bit Quartus15.0 or later is strongly recommended for compiling these projects.

6.1 QDRII+ SRAM Test

QDR II/QDR II+ SRAM devices enable you to maximize memory bandwidth with separate read and write ports. The memory architecture features separate read and write ports operating twice per clock cycle to deliver a total of four data transfers per cycle. The resulting performance increase is particularly valuable in bandwidth-intensive and low-latency applications.

This demonstration utilizes four QDRII+ SRAMs on the FPGA board. It describes how

to use Altera's "Arria 10 External Memory Interfaces" (Arria 10 EMIF) IP to implement a memory test function.

■ Function Block Diagram

Figure 6-1 shows the function block diagram of the demonstration. The four QDRII+ SRAM controllers are configured as a 72Mb controller. The QDRII+ SRAM IP generates a 550MHz clock as memory clock and a half-rate system clock, 275MHz, for the controllers.

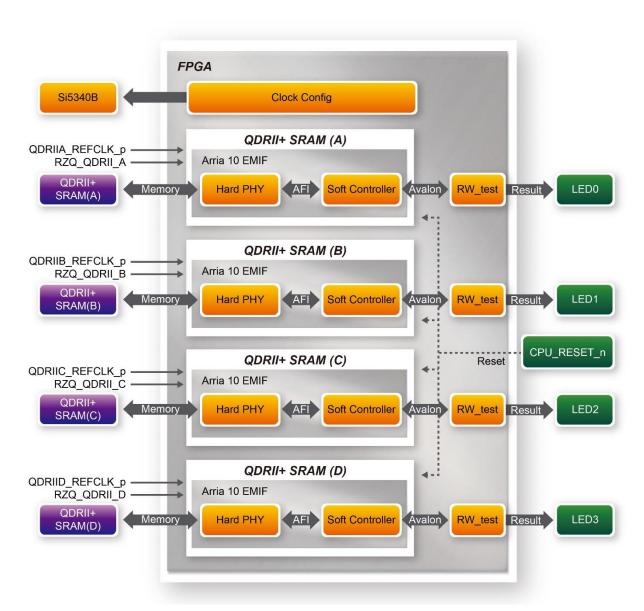

Figure 6-1Function Block Diagram of the QDRII+ SRAM x4 Demonstration

The QDRIIA/B/C/D_REFCLK is generated from Si5340B which configured 275MHz for QDRII+ 550MHz by Clock Config module. QDRIIA/B/C/D_REFCLK has no default

frequency output so that they must be configured first.

In this demonstration, each QDRII+ SRAM has its own PLL, DLL and OCT resources. The Arria 10 EMIF QDRII IP uses a Hard PHY and a soft Controller. The Hard PHY capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The Avalon bus read/write test (RW_test) modules read and write the entire memory space of each QDRII+ SRAM through the Avalon interface of each controller. In this project, the RW_test module will first write the entire memory and then compare the read back data with the regenerated data (the same sequence as the write data). Test control signals for four QDRII+ SRAMs will generate from CPU_RESET_n and four LEDs will indicate the test results of four QDRII+ SRAMs.

Altera QDRII and QDRII+ SRAM Controller with UniPHY

To use Altera QDRII+ SRAM controller, users need to perform the following steps in order:

- 1. Create correct pin assignments for QDRII+.
- 2. Setup correct parameters in QDRII+ SRAM controller dialog.
- Design Tools
- Quartus II 15.1
- Demonstration Source Code
- Project directory: QDRIIx4_Test
- Bit stream used: QDRIIx4_Test.sof
- Demonstration Batch File

Demo Batch File Folder: QDRIIx4_Test\demo_batch

The demo batch files include the followings:

- Batch file for USB-Blaster II: test_ub2.bat,
- FPGA configuration file: QDRIIx4_Test.sof
- Demonstration Setup
- Make sure Quartus II is installed on your PC.
- Connect the USB cable to the FPGA board and host PC. Install the USB-Blaster II

driver if necessary.

- Power on the FPGA Board.
- Execute the demo batch file "test_ub2.bat" under the batch file folder, QDRIIx4_Test\demo_batch.
- Press CPU_RESET_n of the FPGA board to start the verification process. When CPU_RESET_n is held down, all the LEDs will be turned off. All LEDs should turn back on to indicate test passes upon the release of CPU_RESET_n.
- If any LED is not lit up after releasing CPU_RESET_n, it indicates the corresponding QDRII+ SRAM test has failed. Table 6-1 lists the matchup for the four LEDs.
- Press CPU_RESET_n again to regenerate the test control signals for a repeat test.

NAME	Description
LED0	QDRII+ SRAM(A) test result
LED1	QDRII+ SRAM(B) test result
LED2	QDRII+ SRAM(C) test result
LED3	QDRII+ SRAM(D) test result

Table 6-1 LED Indicators

6.2 DDR3 SDRAM Test

This demonstration performs a memory test function on the two DDR3-SDRAM SO-DIMM on the DE5a-Net. The memory size of each DDR3 SDRAM SO-DIMM used in this test is 4 GB.

■ Function Block Diagram

Figure 6-2 shows the function block diagram of this demonstration. There are two DDR3 SDRAM controllers. The controller uses 266.667 MHz as a reference clock. It generates one 1066MHz clock as memory clock from the FPGA to the memory and the controller itself runs at quarter-rate in the FPGA i.e. 266.667MHz.

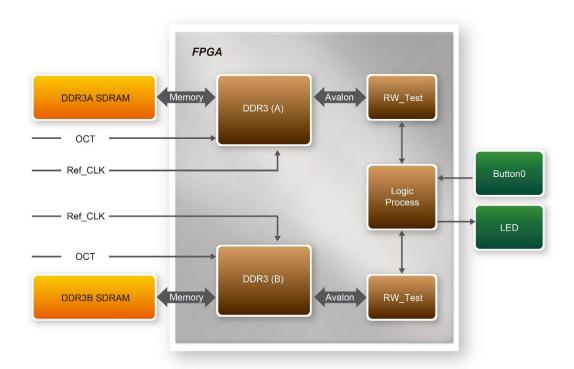

Figure 6-2 Block diagram of DDR3 SDRAM (4G) x2 demonstration

Altera DDR3 SDRAM Controller with UniPHY

To use Altera DDR3 controller, please perform the three major steps below:

- 1. Create correct pin assignments for DDR3.
- 2. Setup correct parameters in the dialog of DDR3 controller.

Design Tools

- Demonstration Source Code
- Project Directory: Demonstration\RTL_DDR3_4GB_x2
- Bit Stream: DE5A_NET_DDR3_4GB.sof
- Demonstration Batch File

Demo Batch File Folder: RTL_DDR3_4GB_x2 \demo_batch

The demo batch file includes following files:

Batch File: test.bat

FPGA Configuration File: DE5A_NET_4GB.sof

Demonstration Setup

- Make sure Quartus II is installed on the host PC.
- Connect DE5a-Net board to the host PC via USB cable. Install the USB-Blaster II driver if necessary.
- Power on the DE5a-Net board.
- Execute the demo batch file "test.bat" under the batch file folder \RTL_DDR3_4GB_x2\demo_batch.
- Press BUTTON0 on DE5a-Net to start the verification process. When BUTTON0 is pressed, LED1, LED2, and LED3 should start blinking. After approximately 2 seconds, LED1 and LED2 should stop blinking and stay on to indicate the DDR3 (A) and DDR3 (B) have passed the test, respectively. Table 6-2 lists the LED indicators.
- If LED3 is not blinking, it means the 50MHz clock source is not working.
- If LED1 or LED2 does not start blinking upon releasing BUTTON0, it indicates local_cal_success of the corresponding DDR3 fails.
- If LED1 or LED2 fail to remain on after 2 seconds, the corresponding DDR3 test has failed.
- Press BUTTON0 again to regenerate the test control signals for a repeat test.

6.3 DDR3 SDRAM Test by Nios II

LED3

Many applications use a high performance RAM, such as a DDR3 SDRAM, to provide temporary storage. In this demonstration hardware and software designs are provided to illustrate how to perform DDR3 memory access in QSYS. We describe how the

Altera's "Arria 10 External Memory Interfaces" IP is used to access the two DDR3-Sodimm on the FPGA board, and how the Nios II processor is used to read and write the SDRAM for hardware verification. The DDR3 SDRAM controller handles the complex aspects of using DDR3 SDRAM by initializing the memory devices, managing SDRAM banks, and keeping the devices refreshed at appropriate intervals.

System Block Diagram

Figure 6-3 shows the system block diagram of this demonstration. The QSYS system requires one 50 MHz and two 200MHz clock source. The two 200 MHz clock source is provided by SI5340B clock generator on the board. Si5340B Config Controller is used to configure the SI5340B to generate the required clock. The 50MHz is used by IOPLL to generate 250MHz for NIOS Processor and On-chip Memory. The two 200MHz clock are used as reference clocks for the DDR3 controllers. There are two DDR3 Controllers are used in the demonstrations. Each controller is responsible for one DDR3-Sodimm. Each DDR3 controller is configured as a 1 GB DDR3-800Mhz controller. The controllers are designed as 1GB rather 4GB is due to address space limitation of NIOS II processor. Nios II processor is used to perform memory test. The Nios II program is running in the On-Chip Memory. A PIO Controller is used to monitor buttons status which is used to trigger starting memory testing.

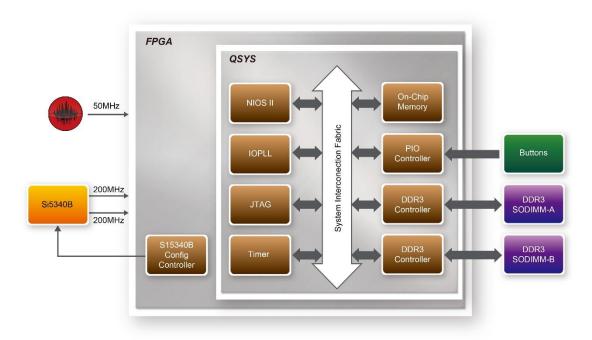

Figure 6-3 Block diagram of the DDR3 Basic Demonstration

The system flow is controlled by a Nios II program. First, the Nios II program writes test

patterns into the whole 1 GB of SDRAM. Then, it calls Nios II system function, alt_dache_flush_all, to make sure all data has been written to SDRAM. Finally, it reads data from SDRAM for data verification. The program will show progress in JTAG-Terminal when writing/reading data to/from the SDRAM. When verification process is completed, the result is displayed in the JTAG-Terminal.

Design Tools

- Quartus II 15.1
- Nios II Eclipse 15.1

■ Demonstration Source Code

- Quartus Project directory: Nios_DDR3_X2
- Nios II Eclipse: NIOS_DDR3_X2\software
- Nios II Project Compilation

Nios II Project Compilation

Before you attempt to compile the reference design under Nios II Eclipse, make sure the project is cleaned first by clicking 'Clean' from the 'Project' menu of Nios II Eclipse.

■ Demonstration Batch File

Demo Batch File Folder: NIOS_DDR3_X2\demo_batch

The demo batch file includes following files:

Batch File for USB-Blaseter II: test.bat, test.sh

FPGA Configure File: DE5A_NET.sof

Nios II Program: TEST_MEM.elf

■ Demonstration Setup

Please follow below procedures to setup the demonstartons.

- Make sure Quartus II and Nios II are installed on your PC.
- Make sure both DDR3 SODIMMs are installed on the FPGA board.
- Power on the FPGA board.

- Use USB Cable to connect PC and the FPGA board and install USB Blaster II driver if necessary.
- Execute the demo batch file "test.bat" under the folder "NIOS_DDR3_X2\demo_batch".
- After Nios II program is downloaded and executed successfully, a prompt message will be displayed in nios2-terminal.
- Press Button3~Button0 of the FPGA board to start SDRAM verify process. Press Button0 for continued test.
- The program will display progressing and result information, as shown in Figure
 6-4.

Figure 6-4 Display Progress and Result Information for the DDR3 Demonstration

Chapter 7

PCI Express Reference Design

CI Express is commonly used in consumer, server, and industrial applications, to link motherboard-mounted peripherals. From this demonstration, it will show how the PC and FPGA communicate with each other through the PCI Express interface. Arria 10 Hard IP for PCI Express with Avalon-MM DMA IP is used in this demonstration. For detail about this IP, please refer to Altera document ug a10 pcie avmm_dma.pdf.

7.1 PCI Express System Infrastructure

Figure 7-1 shows the infrastructure of the PCI Express System in this demonstration. It consists of two primary components: FPGA System and PC System. The FPGA System is developed based on Arria 10 Hard IP for PCI Express with Avalon-MM DMA. The application software on the PC side is developed by Terasic based on Altera's PCIe kernel mode driver.

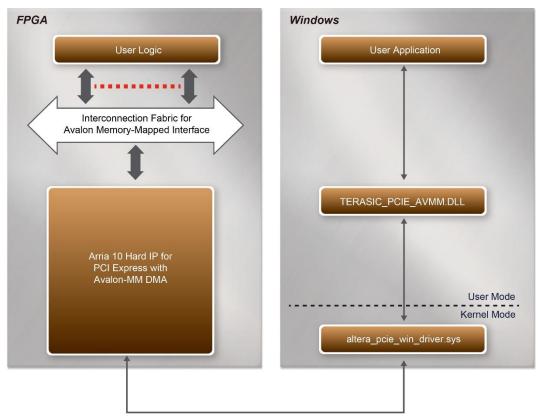

Figure 7-1Infrastructure of PCI Express System

7.2 PC PCI Express Software SDK

The FPGA System CD contains a PC Windows based SDK to allow users to develop their 64-bit software application on Windows 7/Window XP 64-bit. The SDK is located in the "CDROM \demonstrations\PCIe_SW_KIT" folder which includes:

- PCI Express Driver
- PCI Express Library
- PCI Express Examples

The kernel mode driver assumes the PCIe vender ID (VID) is 0x1172 and the device ID (DID) is 0xE003. If different VID and DID are used in the design, users need to modify the PCIe vender ID (VID) and device ID (DID) in the driver INF file accordingly.

The PCI Express Library is implemented as a single DLL named TERASIC_PCIE_AVMM.DLL.

This file is a 64-bit DLL. With the DLL is exported to the software API, users can easily

communicate with the FPGA. The library provides the following functions:

- Basic data read and write
- Data read and write by DMA

For high performance data transmission, Altera AVMM DMA is required as the read and write operations are specified under the hardware design on the FPGA.

PCI Express Software Stack

Figure 7-2 shows the software stack for the PCI Express application software on 64-bit Windows. The PCI Express driver incorporated in the DLL library is called TERASIC_PCIE_AVMM.dll. Users can develop their applications based on this DLL. The altera_pcie_win_driver.sys kernel driver is provided by Altera.

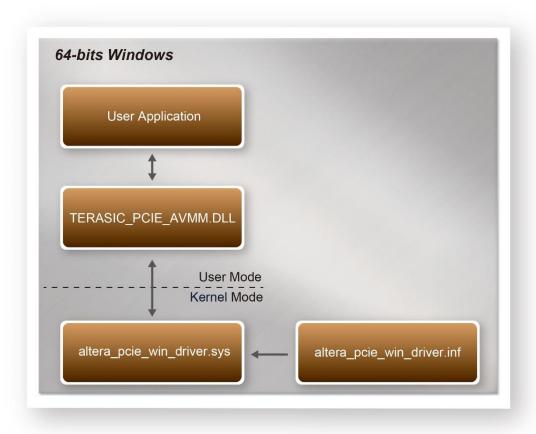

Figure 7-2 PCI Express Software Stack

■ Install PCI Express Driver on Windows

The PCIe driver is locate in the folder:

"CDROM\Demonstrations\PCIe_SW_KIT\PCIe_Driver"

The folder includes the following four files:

- Altera_pcie_win_driver.cat
- Altera_pcie_win_driver.inf
- Altera_pcie_win_driver.sys
- WdfCoinstaller01011.dll

To install the PCI Express driver, please execute the steps below:

- 1. Install the DE5a-Net on the PCIe slot of the host PC
- 2. Make sure Altera Programmer and USB-Blaster II driver are installed
- Execute test.bat in "CDROM\Demonstrations\PCIe_Fundamental\demo_batch" to configure the FPGA
- 4. Restart windows operation system
- 5. Click Control Panel menu from Windows Start menu. Click Hardware and Sound item before clicking the Device Manager to launch the Device Manager dialog. There will be a PCI Device item in the dialog, as shown in Figure 7-3. Move the mouse cursor to the PCI Device item and right click it to select the Update Driver Software... item.

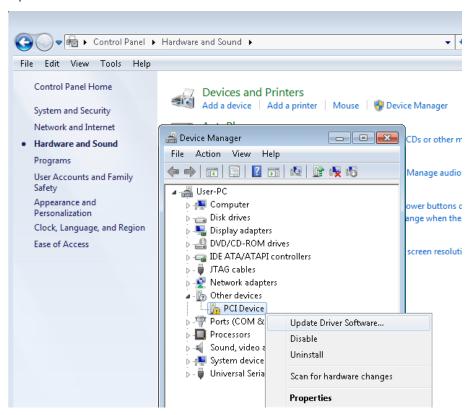

Figure 7-3Screenshot of launching Update Driver Software... dialog

 In the How do you want to search for driver software dialog, click Browse my computer for driver software item, as shown in Figure 7-4

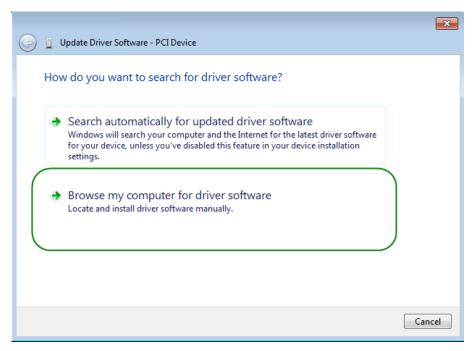

Figure 7-4Dialog of Browse my computer for driver software

7. In the Browse for driver software on your compouter dialog, click the Browse button to specify the folder where altera_pcie_din_driver.inf is located, as shown in Figure 7-5. Click the Next button.

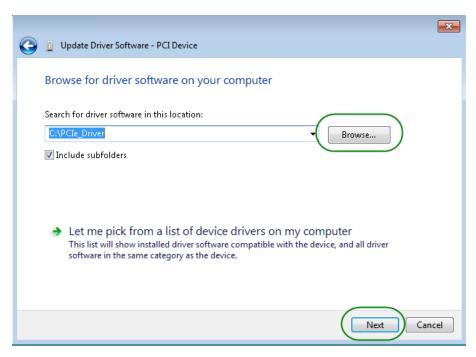

Figure 7-5Browse for driver software on your computer

8. When the **Windows Security** dialog appears, as shown **Figure 7-5**, click the **Install** button.

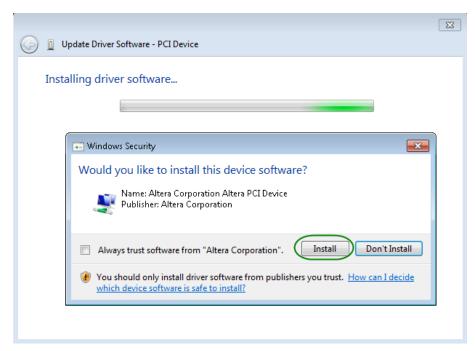

Figure 7-6Click Install in the dialog of Windows Security

9. When the driver is installed successfully, the successfully dialog will appears, as shown in **Figure 7-7**. Click the **Close** button.

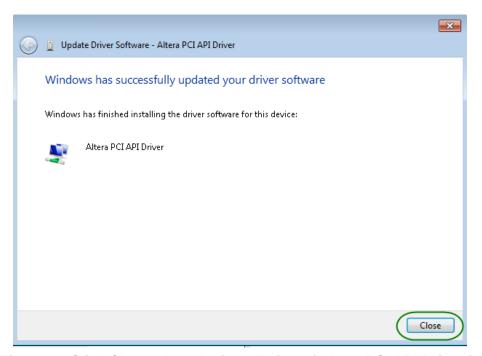

Figure 7-7Click Close when the installation of Altera PCI API Driver is

complete

10. Once the driver is successfully installed, users can see the **Altera PCI API Driver** under the device manager window, as shown in **Figure7-8**.

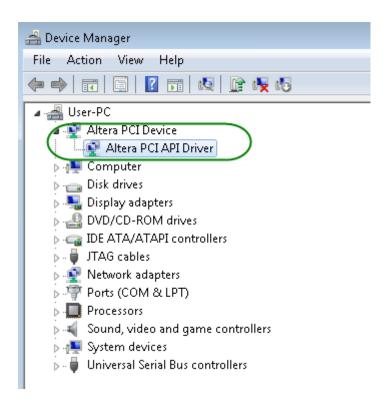

Figure 7-8Altera PCI API Driver in Device Manager

Create a Software Application

All the files needed to create a PCIe software application are located in the directory CDROM\demonstration\PCIe_SW_KIT\PCIe_Library. It includes the following files:

- TERASIC_PCIE_AVMM.h
- TERASIC_PCIE_AVMM.DLL (64-bit DLL)

Below lists the procedures to use the SDK files in users' C/C++ project :

- 1. Create a 64-bit C/C++ project.
- 2. Include TERASIC_PCIE_AVMM.h in the C/C++ project.
- 3. Copy TERASIC_PCIE_AVMM.DLL to the folder where the project.exe is located.
- Dynamically load TERASIC_PCIE_AVMM.DLL in C/C++ program. To load the DLL, please refer to thePCle fundamental example below.
- 5. Call the SDK API to implement the desired application.

Users can easily communicate with the FPGA through the PCIe bus through the TERASIC_PCIE_AVMM.DLL API. The details of API are described below:

PCIE_Open

Function:

Open a specified PCIe card with vendor ID, device ID, and matched card index.

Prototype:

PCIE_HANDLE PCIE_Open(

WORD wVendorID,

WORD wDeviceID,

WORD wCardIndex);

Parameters:

wVendorID:

Specify the desired vendor ID. Azero value means to ignore the vendor ID.

wDeviceID:

Specify the desired device ID. A zero value means to ignore the device ID.

wCardIndex:

Specify the matched card index, a zero based index, based on the matched verder ID and deviceID.

Return Value:

Return a handle to presents specified PCIe card. A positive value is return if the PCIe card is opened successfully. A value zero means failed to connect the target PCIe card.

This handle value is used as a parameter for other functions, e.g. PCIE_Read32.

Users need to call PCIE_Close to release handle once the handle is no more used.

PCIE_Close

Function:

Close a handle associated to the PCIe card.

Prototype:

void PCIE_Close(

PCIE_HANDLE hPCIE);

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

Return Value:

None.

■ PCIE Read32

Function:

Read a 32-bit data from the FPGA board.

Prototype:

bool PCIE_Read32(

PCIE_HANDLE hPCIE,

PCIE_BAR PcieBar,

PCIE_ADDRESS PcieAddress,

DWORD *pdwData);

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

PcieBar:

Specify the target BAR.

PcieAddress:

Specify the target address in FPGA.

pdwData:

A buffer to retrieve the 32-bit data.

Return Value:

Return TRUE if read data is successful; otherwise FALSE is returned.

■ PCIE Write32

Function:

Write a 32-bit data to the FPGA Board.

Maximal write size is (4GB-1) bytes.

Prototype:

bool PCIE_Write32(

PCIE_HANDLE hPCIE,

PCIE_BAR PcieBar,

PCIE_ADDRESS PcieAddress,

DWORDdwData);

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

PcieBar:

Specify the target BAR.

PcieAddress:

Specify the target address in FPGA.

dwData:

Specify a 32-bit data which will be written to FPGA board.

Return Value:

Return TRUE if write data is successful; otherwise FALSE is returned.

■ PCIE DmaRead

Function:

Read data from the memory-mapped memory of FPGA board in DMA.

Maximal read size is (4GB-1) bytes.

Prototype:

```
bool PCIE_DmaRead(
PCIE_HANDLE hPCIE,
PCIE_LOCAL_ADDRESS LocalAddress,
void *pBuffer,
DWORD dwBufSize
);
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

LocalAddress:

Specify the target memory-mapped address in FPGA.

pBuffer:

A pointer to a memory buffer to retrieved the data from FPGA. The size of buffer should be equal or larger the dwBufSize.

dwBufSize:

Specify the byte number of data retrieved from FPGA.

Return Value:

Return TRUE if read data is successful; otherwise FALSE is returned.

■ PCIE DmaWrite

Function:

Write data to the memory-mapped memory of FPGA board in DMA.

Prototype:

```
bool PCIE_DmaWrite(
PCIE_HANDLE hPCIE,
PCIE_LOCAL_ADDRESS LocalAddress,
void *pData,
DWORDdwDataSize
):
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

LocalAddress:

Specify the target memory mapped address in FPGA.

pData:

A pointer to a memory buffer to store the data which will be written to FPGA.

dwDataSize:

Specify the byte number of data which will be written to FPGA.

Return Value:

Return TRUE if write data is successful; otherwise FALSE is returned.

■ PCIE_ConfigRead32

Function:

Read PCIe Configuration Table. Read a 32-bit data by given a byte offset.

Prototype:

```
bool PCIE_ConfigRead32 (
PCIE_HANDLE hPCIE,
DWORD Offset,
DWORD*pdwData
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

Offset:

Specify the target byte of offset in PCIe configuration table.

pdwData:

A 4-bytes buffer to retrieve the 32-bit data.

Return Value:

Return TRUE if read data is successful; otherwise FALSE is returned.

7.3 PCIeReference Design - Fundamental

The application reference design shows how to implement fundamental control and data transfer in DMA. In the design, basic I/O is used to control the BUTTON and LED

on the FPGA board. High-speed data transfer is performed by DMA.

■ Demonstration Files Location

The demo file is located in the batch folder:

CDROM\demonstrations\PCIe_funcdamental\Demo_batch

The folder includes following files:

- FPGA Configuration File: DE5A_NET.sof
- Download Batch file: test.bat
- Windows Application Software folder: windows_app, includes
 - ♦ PCIE_FUNDAMENTAL.exe
 - ♦ TERASIC_PCIE_AVMM.dll

Demonstration Setup

1. Install the FPGA board on your PC as shown in Figure 7-9.

Figure 7-9 FPGA board installation on PC

- 2. Configure FPGA with PCIE_Fundamental.sofby executing the test.bat.
- 3. Install PCIe driver if necessary. The driver is located in the folder: CDROM\Demonstration\PCIe_SW_KIT\PCIe_Driver.
- 4. Restart Windows
- 5. Make sure the Windows has detected the FPGA Board by checking the Windows Control panel as shown in **Figure 7-10**.

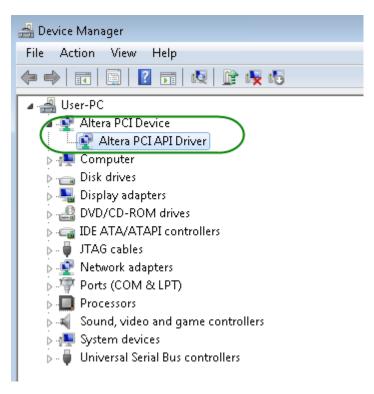

Figure 7-10 Screenshot for PCle Driver

Gotowindows_app folder, execute PCIE_FUNDMENTAL.exe. A menu will appear as shown in Figure 7-11.

■ FPGA Application Design

Figure 7-15 shows the system block diagram in the FPGA system. In the Qsys, Altera PIO controller is used to control the LED and monitor the Button Status, and the On-Chip memory is used for performing DMA testing. The PIO controllers and the On-Chip memory are connected to the PCI Express Hard IP controller through the Memory-Mapped Interface.

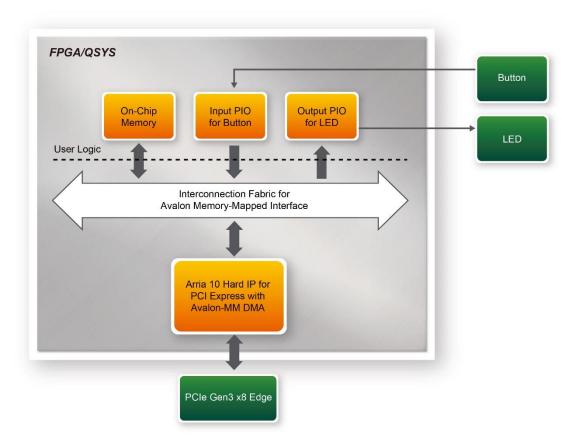

Figure 7-15 Hardware block diagram of the PCle reference design

■ Windows Based Application Software Design

The application software project is built by Visual C++ 2012. The project includes the following major files:

Name	Description	
PCIE_FUNDAMENTAL.cpp	Main program	
PCIE.c	Implement dynamically load for	
PCIE.h	TERAISC_PCIE_AVMM.DLL	
TERASIC_PCIE_AVMM.h	SDK library file, defines constant and data structure	

The main program PCIE_FUNDAMENTAL.cpp includes the header file "PCIE.h" and defines the controller address according to the FPGA design.

The base address of BUTTON and LED controllers are 0x4000010 and 0x4000020 based on PCIE_BAR4, in respectively. The on-chip memory base address is 0x00000000 relative to the DMA controller.

Before accessing the FPGA through PCI Express, the application first calls PCIE_Load to dynamically load the TERASIC_PCIE_AVMM.DLL. Then, it call PCIE_Open to open the PCI Express driver. The constant DEFAULT_PCIE_VID and DEFAULT_PCIE_DID used in PCIE_Open are defined in TERASIC_PCIE_AVMM.h.If developer change the Vender ID and Device ID and PCI Express IP, they also need to change the ID value define in TERASIC_PCIE_AVMM.h. If the return value of PCIE_Open is zero, it means the driver cannot be accessed successfully. In this case, please make sure:

- The FPGA is configured with the associated bit-stream file and the host is rebooted.
- The PCI express driver is loaded successfully.

The LED control is implemented by calling PCIE_Write32 API, as shown below:

```
bPass = PCIE_Write32(hPCIe, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_LED_ADDR,(DWORD)Mask);
```

The button status query is implemented by calling the **PCIE_Read32** API, as shown below:

```
PCIE_Read32(hPCIe, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_BUTTON_ADDR,&Status);
```

The memory-mapped memory read and write test is implemented by **PCIE_DmaWrite** and **PCIE_DmaRead** API, as shown below:

```
PCIE_DmaRead(hPCIe, LocalAddr, pRead, nTestSize);
```

7.4PCIeReference Design –DDR3

The application reference design shows how to add DDR3 Memory Controllers for DDR3-A SODIMM and DDR3-B SODIMM into the PCIeQuartus project based on the PCI_FundamentalQuartus project and perform 2GB data DMA for both SODIMM. Also, this demo shows how to call "PCIE_ConfigRead32" API to check PCIe link status.

Demonstration Files Location

The demo file is located in the batch folder:

CDROM\demonstrations\PCIe_DDR3\Demo_batch

The folder includes following files:

- FPGA Configuration File: DE5A_NET.sof
- Download Batch file: test.bat
- Windows Application Software folder: windows_app, includes
 - ♦ PCIE_DDR3.exe
 - ♦ TERASIC_PCIE_AVMM.dll

■ Demonstration Setup

- 1. Install both DDR3 2133 4GB SODIMM on the FPGA board.
- 2. Install the FPGA board on your PC.
- 3. Configure FPGA with PCIE_DDR3.sof by executing the test.bat.
- 4. Install PCIe driver if necessary.
- 5. Restart Windows
- Make sure the Windows has detected the FPGA Board by checking the Windows Control panel.
- 7. Gotowindows_app folder, execute PCIE_DDR3.exe. A menu will appear as shown in **Figure 7-16**.

Figure 7-16 Screenshot of Program Menu

8. Type 2 followed by a ENTERY key to select Link Info item. The PICe link information will be shown as in **Figure 7-17**. Gen3 link speed and x8 link width are expected.

Figure 7-17 Screenshot of Link Info

Type 3 followed by an ENTERY key to select DMA On-Chip Memory Test item. The DMA write and read test result will be report as shown in Figure 7-18.

Figure 7-18 Screenshot of On-Chip Memory DMA Test Result

10. Type-4 followed by an ENTERY key to select DMA DDR3-A SODIMM Memory Test item. The DMA write and read test result will be report as shown in **Figure 7-19**.

■ FPGA Application Design

Figure 7-21 shows the system block diagram in the FPGA system. In the Qsys, Altera PIO controller is used to control the LED and monitor the Button Status, and the On-Chip memory is used for performing DMA testing. The PIO controllers and the On-Chip memory are connected to the PCI Express Hard IP controller through the Memory-Mapped Interface.

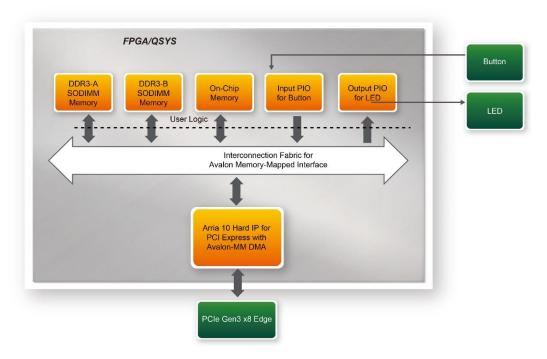

Figure 7-21 Hardware block diagram of the PCleDDR3 reference design

■ Windows Based Application Software Design

The application software project is built by Visual C++ 2012. The project includes the following major files:

Name	Description
PCIE_DDR3.cpp	Main program
PCIE.c	Implement dynamically load for
PCIE.h	TERAISC_PCIE_AVMM.DLL
TERASIC_PCIE_AVMM.h	SDK library file, defines constant and data structure

The main program PCIE_DDR3.cpp includes the header file "PCIE.h" and defines the controller address according to the FPGA design.

The base address of BUTTON and LED controllers are 0x4000010 and 0x4000020 based on PCIE_BAR4, in respectively. The on-chip memory base address is 0x00000000 relative to the DMA controller. The above definition is the same as those in PCIe Fundamental demo.

Before accessing the FPGA through PCI Express, the application first calls PCIE_Load to dynamically load the TERASIC_PCIE_AVMM.DLL. Then, it call PCIE_Open to open the PCI Express driver. The constant DEFAULT_PCIE_VID and DEFAULT_PCIE_DID used in PCIE_Open are defined in TERASIC_PCIE_AVMM.h.If developer change the Vender ID and Device ID and PCI Express IP, they also need to change the ID value define in TERASIC_PCIE_AVMM.h. If the return value of PCIE_Open is zero, it means the driver cannot be accessed successfully. In this case, please make sure:

- The FPGA is configured with the associated bit-stream file and the host is rebooted.
- The PCI express driver is loaded successfully.

The LED control is implemented by calling PCIE_Write32 API, as shown below:

```
bPass = PCIE_Write32(hPCIe, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_LED_ADDR,(DWORD)Mask);
```

The button status query is implemented by calling the **PCIE_Read32** API, as shown below:

```
PCIE_Read32(hPCIe, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_BUTTON_ADDR,&Status);
```

The memory-mapped memory read and write test is implemented by **PCIE_DmaWrite** and **PCIE_DmaRead** API, as shown below:

```
PCIE_DmaRead(hPCIe, LocalAddr, pRead, nTestSize);
```

The pcie link information is implemented by PCIE_ConfigRead32 API, as shown below:

```
// read config - link status
if (PCIE_ConfigRead32(hPCIe, 0x90, &Data32)){
  switch((Data32 >> 16) & 0x0F){
                  printf("Current Link Speed is Gen1\r\n");
              case 2:
                 printf("Current Link Speed is Gen2\r\n");
                  break;
              case 3:
                  printf("Current Link Speed is Gen3\r\n");
                  break;
              default:
                  printf("Current Link Speed is Unknown\r\n");
                  break;
  switch((Data32 >> 20) & 0x3F){
              case 1:
                 printf("Negotiated Link Width is x1\r\n");
                 break;
              case 2:
                  printf("Negotiated Link Width is x2\r\n");
                  break;
              case 4:
                 printf("Negotiated Link Width is x4\r\n");
                  break;
              case 8:
                  printf("Negotiated Link Width is x8\r\n");
                  break:
              case 16:
                  printf("Negotiated Link Width is x16\r\n");
                  break;
              default:
                  printf("Negotiated Link Width is Unknown\r\n");
                  break;
  3
}else{
 bPass = false;
```

Chapter 8

Transceiver Verification

his chapter describes how to verify the FPGA transceivers for the QSFP+ by using the test code provided in the DE5a-Net system CD.

8.1 Function of the Transceiver Test Code

The transceiver test code is used to verify the transceiver channels for the QSPF+ ports through an external loopback method. The transceiver channels are verified with the data rates 10.3125 Gbps with PRBS31 test pattern.

8.2 Loopback Fixture

To enable an external loopback of transceiver channels, one of the following two fixtures are required:

- QSFP+ Cable, as shown in Figure 8-1
- QSFP+ Loopback fixture, as shown in Figure 8-2

Figure 8-1 Optical QSFP+ Cable

Figure 8-2QSFP+ Loopback Fixture

Figure 8-3 shows the FPGA board with two QSFP+ cable installed. **Figure 8-4** shows the FPGA board with four QSFP+ loopback fixtures installed.

Figure 8-3 Two QSFP+ Cables Installed

Figure 8-4 Four QSFP+ Loopback Fixtures Installed

8.3 Testing

The transceiver test code is available in the folder System CD\Tool\Transceiver_Test. Here are the procedures to perform transceiver channel test:

- 1. Copy Transceiver_Test folder to your local disk.
- 2. Ensure that the FPGA board is NOT powered on.
- 3. Plug-in the QSPF+ loopback fixtures.
- 4. Connect your FPGA board to your PC with a mini USB cable.
- 5. Power on the FPGA board
- 6. Execute 'test.bat" in the Transceiver_Test folder under your local disk.
- 7. The batch file will download .sof and .elf files, and start the test immediately. The test result is shown in the Nios-Terminal, as shown in **Figure 8-5**.
- 8. To terminate the test, press one of the BUTTON0~3 buttons on the FPGA board. The loopback test will terminate as shown in **Figure 8-6**.
